Raising the Voice of the Patients

A PATIENT’S GUIDE TO LIVING WITH RHEUMATOID ARTHRITIS

First Edition

©2016 Global Healthy Living Foundation, Inc.
Welcome to the first edition of CreakyJoints’ patient guidelines for rheumatoid arthritis. It is designed to help raise your voice with the decision-makers you'll encounter while living with this disease. This guide is the first of its kind, and it is developed by leading experts including doctors, patients, and other healthcare providers. It’s meant to serve as a roadmap to help you navigate your rheumatoid arthritis, while helping you get what you want, need, and deserve from your treatment journey. It offers detailed, accessible explanations of symptoms and what causes them, treatment plans, treatment options, integrated medicines and therapies, diet and exercise, as well as how to talk to your insurance company and your family and friends about your disease and the ways in which it impacts your life. This first edition has been edited by leading doctors and healthcare experts, and will be updated and improved regularly as new research, information, and treatments on RA become available. These patient guidelines for RA are the first in a series of guidance CreakyJoints plans to produce — editions focused on other autoimmune diseases are forthcoming. The information in these guidelines should never replace the information and advice from your treating physician. It is meant to inform the discussion that you have with healthcare professionals, as well as others who play a role in your care and well being.

PART ONE
Patient Charter

CreakyJoints is a patient-powered community of people with arthritis (and their families) that is part of the non-profit Global Healthy Living Foundation. The CreakyJoints patient charter reflects our guiding principles, or the deeply held beliefs that drive our community’s many efforts in arthritis education, support, advocacy, and research.

WE BELIEVE:

1. The patient experience is at the heart of medicine; thus the patient must be at the center of all medical decision making.

2. The medical process should stay between the patient and their care provider.

3. The patient should have access to all treatments deemed appropriate by their care provider.

4. Access to care should not be limited by external forces, financial or otherwise.

5. Patients should be empowered and educated with the tools needed to make their voices heard.

6. Elected officials, insurance providers, drug manufacturers, and all those associated with the healthcare system shall make it their goal to ensure the patient is the focus of all decisions.

7. The medical team should strive not only to do no physical harm, but to do no emotional, mental, or financial harm to the patient.

8. Patients should be treated with dignity, transparency, and respect by everyone involved in the healthcare process.
**RAISE YOUR VOICE:** Get Active, Advocate, and Take Charge of Your Healthcare!

**Speak up** at each doctor’s appointment. **Bring a notebook** with you or **use your smartphone’s Notes app** to write down information about your treatments, as well as your questions and concerns.

**Write down** questions or concerns ahead of time so you don’t forget them at your appointments.

**Always ask** about the costs of each potential treatment, as well as any possible side effects.

**Join other arthritis patients** in local or national advocacy groups like CreakyJoints’ 50-State Network. **Be an advocate** to make sure your opinions and concerns are always heard by the people who create healthcare laws.

Use the power of technology! **Email or direct-message** other arthritis patients online on CreakyJoints.org’s Facebook or Twitter page, or on other social media platforms. As you get to know other patients, start one-on-one conversations on the phone or via text so you stay informed.

**Add your name or sign online petitions** with a simple click. You will make every advocacy effort stronger by joining with others.

**Stay informed** on social media and lend your voice to arthritis advocacy or healthcare issues when the time is right for you. Go online, sign up, join phone or email chats, share your thoughts and attend live arthritis advocacy events when you can. Check out Facebook.com/CreakyJoints or @CreakyJoints on Twitter.

**Share your opinion or experiences.** Fill out patient surveys. Talk to arthritis advocacy groups looking for patient input on important healthcare issues. Offer your thoughts on Facebook or other social media, but remember that nothing is private online so think about what you want others to know. You don’t always have to give your name, but when it’s appropriate, let others — including elected officials in your state government and at the national level — know that you are a constituent, you vote, and you care about these issues! Choose email, mail, postcards, social media, phone calls, or in-person meetings — whatever works best for you.

**Stay informed and up to date.** There may be ways for you to get help affording your treatments, new treatments that may be more effective or affordable for you, or clinical trials going on in your area. Follow CreakyJoints at www.creakyjoints.org for news and articles about patients like you to find out how others are dealing with treatments or coverage challenges. Follow @creakyjoints on Twitter, or like the CreakyJoints Facebook page to hear news updates and share your thoughts. Also, check out the American College of Rheumatology’s website, www.rheumatology.org, for news updates on RA and new treatment approvals.

**Speak up** about your side effects or concerns about your treatments. Don’t tell yourself that you just have to put up with it or downplay these effects. Your doctor may be able to make changes to your treatment plan to help ease your side effects.

**Look for patient assistance programs** from your drug’s manufacturer if you struggle to afford copayments or coinsurance costs. Ask your doctor’s office or pharmacy about any coupons or rebates available for you. Go online to find your drug’s website, where these programs will be listed. You may be eligible for these programs, so find out! A great resource is: https://creakyjoints.org/support/arthritis-copay-cards-assistance/

**Ask your doctor about clinical trials** for new or existing RA treatments that may be available for you. Ask about current trials, and if you qualify for one, ask about any costs you may have to bear (such as travel to a clinic), or the trial’s possible risks and benefits for you.
Patient Charter

**Talk to your rheumatologist about biosimilars.** These are new drugs being approved now for RA. They may offer you effective treatment at lower cost, but not every drug is right for every patient. So talk to your doctor about your options. Also, ask your insurance company or specialty pharmacy about your out-of-pocket cost for both your biologic and its biosimilar if there is one. You deserve clear, simple information on all your treatment options. GHLF’s page healthybiologics.org is one good source of information.

**Treat your emotional and mental health symptoms as seriously as your physical RA symptoms.** Tell your rheumatologist and nurses if you’re anxious, depressed, blue, not sleeping at night, or not able to get through the day because you’re worried about RA. Seek care from a mental-health professional or counselor. Find support and comfort from other RA patients in local groups or online. Remember that you are not alone.

**Take advantage of any program that could help you afford the RA treatments you need and deserve.** Ask your doctor or nurses about copay assistance programs like coupons or rebates from your treatment’s manufacturer. Also, go online to find your drug’s website. Look for patient assistance programs there that may help you lower your out-of-pocket costs if you qualify. Also, call your insurance company to ask about the details of your drug coverage, talk to your pharmacist or call your specialty pharmacy to ask about your options or possible discounts. Compare pharmacies’ prices if that’s an option for your drug coverage.

**Ask your employer’s HR department** if your insurer has a patient advocate or employee assistance programs as part of your coverage. These advocates or advocacy programs are designed to work on your behalf to provide information or assistance related to your healthcare.

▲ The information in these guidelines should never replace the information and advice from your treating physician. It is meant to inform the discussion that you have with healthcare professionals, as well as others who play a role in your care and well being.
When you have rheumatoid arthritis (RA), you want to make sure you’re getting the right treatments for your symptoms, feeling better, and protecting your joints and organs from possible damage.

You can make sure that you’re receiving the right treatment by working with your rheumatologist to come up with a plan designed for your specific RA. Remember, RA is a specific form of arthritis that is different than degenerative arthritis, which is also known as osteoarthritis, or OA. Your RA journey will not be the same as others with RA. Your disease is personal and it is important to remember that not everyone fits into the same box.

What’s the goal of your treatment plan for RA? Most of the time, your doctor will aim for low disease activity or remission. At first, the plan may be to just get your inflammation and RA symptoms under control.

Every person’s RA is different. You won’t start at the same point as other people with this disease. But no matter where your starting point is, you’ll take certain RA treatments in order to reach low disease activity or remission.

In these guidelines, we’ll talk about all of your treatment options, including things that you can do in addition to taking drugs, like:

- Integrative medicine and complimentary therapies, including herbs and supplements
- Exercise, including yoga and aerobic workouts like walking or swimming
- Diet changes you can make to stay at a healthy weight and protect your heart and joints

The most important part of your treatment plan is you. You’re the one living with RA every day. You’re the one who feels the pain, stiffness, fatigue, and stress that sometimes comes with it. You’re the one who has to manage your life with RA, including taking your meds and juggling appointments. The guidelines outline the most commonly understood treatments, but research is still being made to improve life with RA.

We want you to be an active part of your arthritis treatment and care. That’s why we created this guide: So you can see which drugs are recommended to treat your RA, why you may want to try some drugs or combos before you switch to something else, and what other kinds of therapies may work for your symptoms too.

After you read this guide, you can have a discussion with your rheumatologist about your treatment options — not just listen. You may find that you have new questions about your treatment plan. You can feel more in control of your journey with RA, one that will lead you to a better quality of life and peace of mind.

This guide will also help you as you talk to your insurance company, your pharmacist, your benefits manager at work, or even your members of Congress. How many times have you wanted to speak up about your...
prescriptions, or ask questions about how well they work or their side effects — but didn’t feel that you knew where to start? Now you can.

**RAISE YOUR VOICE:** You are never alone on your RA journey. **Join with other arthritis patients** in local or national advocacy groups like CreakyJoints’ 50-State Network. **Be an advocate** to make sure your opinions and concerns are always heard by the people who create healthcare laws. Being an advocate doesn’t mean you have to sit through lengthy meetings or write lots of letters — those are not everyone’s favorite things to do, and you may worry that you don’t have time to devote to advocacy. **But it’s actually easy.** You can **email** other arthritis patients online and start talking about current treatments, insurance coverage issues, or new laws affecting your access to arthritis drugs. You can **add your name or sign online petitions** with a simple click. Or you can just **stay informed** on social media and lend your voice when the time is right for you. Go online, sign up, join phone or email chats, share your thoughts, and attend live events if you can. Check out [Facebook.com/CreakyJoints](http://facebook.com/CreakyJoints) or [@CreakyJoints](http://twitter.com/CreakyJoints) on Twitter. There’s strength in numbers!
So how does your rheumatologist or other health professional come up with your treatment plan?

The primary way is to follow the current RA treatment guidelines. These guidelines are published by the American College of Rheumatology (ACR), the professional association of rheumatologists in the U.S. Guidelines are usually written and funded by doctors’ associations — what we call the “professional medical societies.” The ACR is the world’s largest society of rheumatologists and rheumatology health professionals. Every two years, guidelines for major types of arthritis, including RA, are updated. Why? So new, important research can be considered by the best arthritis experts, and then they can all agree on how to turn that information into up-to-date recommendations for your arthritis treatment.

You can read the full, published guidelines online. If you find it a little hard to understand, that’s because the RA treatment guidelines are written for doctors and other healthcare professionals.

Leading experts on arthritis create the guidelines as a team. This team or panel includes rheumatologists, rheumatology health professionals, and patients like you. They come up with a final report full of recommendations based on recent scientific information and patient feedback about how best to treat RA. They’re meant to help your doctor make decisions about your prescriptions and other approaches to disease management. They recommend what treatments to use first in most people with RA, and then other options if the first try doesn’t work well enough to lower your disease activity. It’s hard to say how well you may or may not respond to a particular drug. Remember, guidelines are just recommendations. Each person with RA is different and there is no “one size fits all” when it comes to treating RA.

RAISE YOUR VOICE: If your rheumatologist asks you to be a part of a patient focus group or local advocacy event, or even just to answer a patient survey about arthritis treatments, take part if you have time. Even a little information from the patient’s point of view can help influence healthcare policies that benefit you and others who are taking the same journey. Share your opinions, feelings, and advice with other RA patients and their families. You’ll find that you’re part of a caring, powerful community.

Your doctor may use the guidelines to decide if and when now is the best time for you to switch treatments — such as if your first treatment doesn’t work well enough to control your inflammation and lower your disease activity score. Guidelines are recommendations — based on the best information on RA treatments available, and updated regularly (every other year).

Guidelines’ recommendations are often used by people who make decisions about how RA is treated, including:

- Doctors like your rheumatologist or primary-care physician
- Nurses, nurse practitioners, or physician assistants who treat arthritis patients
- Insurance company staff who decide which drugs to cover in their formularies
Pharmacists who dispense drugs, including at mail-order specialty pharmacies

Members of Congress or state legislatures, who vote on drug and healthcare laws

All recommendations for how to treat different types of RA patients are based on evidence. That means the experts who write the guidelines take these important steps:

- Gather research done at the world's top hospitals, universities, and labs by the top experts in arthritis, including current studies and data published in top medical journals around the world
- Read, discuss, and debate all of the evidence on RA treatments in these studies
- Go over everything from drug side effects, interactions, risks of using treatments in patients with other diseases, ease of using the drug in real life, and even availability and cost
- Come up with recommendations based on this evidence on how to best treat people with RA

So that’s why we’ve created these RA treatment guidelines for you. It’s written by patients just like you, and it’s designed for you to read and understand easily. You can use it when you: 

- Talk to your rheumatologist or other health professionals about your treatment plan
- Call your insurance company about which drugs are covered under your policy
- Meet with your local legislator or write your member of Congress about healthcare laws

You can use these recommendations to be an active voice in the conversation about your health and your RA treatment options. Too often, people who have RA aren’t a part of conversations about their care, or the big debates about which arthritis drugs insurance plans will cover. You may feel like your doctor just hands you a prescription to fill, but you don’t get to really talk about your treatment options — or what may happen once you are taking them. You may feel like your insurance company just decides which drugs are best for you — instead of getting your input on what really works and what’s most “cost-effective.”

**RAISE YOUR VOICE:** When you and your healthcare provider decide on a treatment plan, you’re likely to encounter challenges along the way in accessing that care. You will inevitably become familiar with terms like “fail first,” “step therapy,” and “prior authorization,” which all refer to processes established by health insurance companies to manage care to control costs — many times to the detriment of the patient. It is important to understand how these processes work so that you are prepared to advocate for yourself when you speak to your insurance company and doctor — especially if you are denied access to a medication you need. Information can be found online at [www.FailFirstHurts.org](http://www.FailFirstHurts.org), as well as from your individual insurance company. GHLF’s advocacy initiative, the 50-State Network, is a coalition of patients that works to bring the patient perspective to state and federal lawmakers considering policies to prevent step therapy, which can wreak havoc on the lives of patients with chronic disease.

These guidelines will give you all the information about RA treatments you need to make informed decisions, ask questions, and speak up about your healthcare. New treatments for RA are being studied now, and many will be approved and available for you to take in the next few years. So we’ll update these guidelines regularly. That way you can get up-to-date information about all the treatments for RA.
Treatment Guidelines

RAISE YOUR VOICE: Stay up to date with the latest changes to arthritis treatment guidelines and current drug approvals by following CreakyJoints online. Go to www.creakyjoints.org for news and articles about patients like you to find out how others are dealing with treatments or coverage challenges. Follow @CreakyJoints on Twitter, or like the CreakyJoints Facebook page to hear news updates and share your thoughts. Other sources: For updated guidelines and new treatment approvals, check out the American College of Rheumatology’s website, www.rheumatology.org. The FDA, www.fda.gov, also posts updates on new arthritis treatments. Information is power, and it’s just a click away on your phone, tablet, or computer.

We are including some information about arthritis medicines that are not yet available in the U.S. These are still being studied in what are called clinical trials (which we’ll also explain). We want you to know what treatments may be in the works so you can keep an eye on the news and be ready to ask your doctor about them if they’re approved soon.

As your doctor and you begin a treatment plan, you can talk more about what options may work best for you. If you have any specific questions or concerns about your treatments — including possible side effects, cost, how they need to be taken or stored, how they may affect your family planning goals — please let your doctor know.

We hope this guide will help you feel more confident about asking questions and speaking up about your treatment plan.

RAISE YOUR VOICE: Don’t wait until side effects become too much to bear to speak up about your treatments. Call, email, or speak to your doctor’s office right away to see if you can change your dose, take your drugs with food to ease nausea, switch drugs, or take another medication along with your drug to ease these effects. Also, if you struggle to afford your treatment copays, coinsurance costs, or payments against your insurance deductible, please contact your doctor’s office, pharmacist, insurance company, or even the drug’s manufacturer to find out if you can get help with these costs. Don’t skip a dose of your medicine or stop taking it before you let your doctor know.

The information in these guidelines should never replace the information and advice from your treating physician. It is meant to inform the discussion that you have with healthcare professionals, as well as others who play a role in your care and well being.
RA symptoms are caused by inflammation. That means your body's immune system is releasing chemicals into your blood and joints that cause pain, swelling, stiffness, and fatigue. Why? Because when you have RA, the normal signals that tell your immune system to spring into action — to protect your body from harm by viruses, bacteria, or injuries — are crossed. That's called autoimmunity. In an autoimmune disease like RA, your immune system triggers inflammation and attacks your healthy joints and tissues by mistake. That's why you have pain, swelling, and other symptoms. Sometimes you feel like your immune system is constantly attacking your body; at other times symptoms will come and go. As a reminder, RA is different than OA (osteoarthritis), which is caused by mechanical wear and tear on joints, not an autoimmune process. However, both types of arthritis may occur at the same time.

Even over just a few months or years, RA inflammation can do a lot of damage to the lining around your joints, called the synovium. This inflamed lining can cause damage to the tissues around your joint, like your cartilage or ligaments that hold the joint together. When your cartilage breaks down, your bones can rub against each other and cause more pain. If your ligaments tear, your joints may dislocate and later become deformed. If that happens, joints can look twisted or gnarled, and be harder to move.

Symptoms of RA can be different for each person, but here are the most common ones:

- Joint pain, swelling, or redness, often in the same joint on both sides of your body
- Morning stiffness lasting over an hour with “regelling,” or stiffness, after sitting for a while
- Fatigue, or feeling very tired most of the time
- Feeling sick, almost like you have the flu
- Achy muscles
- Loss of your appetite, so you may lose weight without wanting to
- Rheumatoid nodules, or swollen bumps under your skin around your joints
- Painful reactions in your eyes or in the lining around your heart or lungs (less common than other symptoms)
- Cognitive dysfunction (“brain fog”) — a decrease in your ability to think, remember, or concentrate to the point that it interferes with your daily functioning. The exact cause of this is unknown. It could be related to the inflammation, chronic pain, or even lack of sleep.

RA can cause you to develop holes or “erosions” in the bones around your joints. These erosions are caused by inflammatory substances that can dissolve tiny parts of the bone. This is also called “erosive disease.” Early treatment may help you prevent bony erosions, so it’s important to get a diagnosis as soon as you can.

To prevent these painful bone problems from happening or to slow them down, you have to get your inflammation under control. That’s what your treatment plan — including your RA drugs and other steps like exercise — is designed to do. You want to get inflammation and your disease activity under control.

There are signs of inflammation in your blood that your doctor can test. These test results can show how active your disease is and how well your treatments are working. These are often called inflammatory markers. You should know that not everyone’s markers correlate with their disease activity. You may be having pain and swelling while these markers look normal or vice versa:

- Erythrocyte sedimentation rate (ESR) or “sed rate”
- C-reactive protein or CRP

Your blood may also have other “markers” that show up as a positive result on tests. Not everyone with RA tests positive for these markers. You may hear your doctor refer to this as “seronegative” rheumatoid arthritis. But if you do test positive for these markers, they may remain in your blood even if your RA goes into remission after treatment:

- Rheumatoid factor or RF (not everyone who has a + RF has rheumatoid arthritis)
- Anti-cyclic citrullinated peptide proteins or “anti-CCP”
Different doctors use different scoring systems to measure your disease activity and check your progress, such as DAS 28, CDAl, SDAI, and RAPID3. These scores may look at different test results or physical exam results, but they’re all based on specific measures. Using these scoring methods can be helpful to your doctor in determining if you are responding to treatment.

Low disease activity, or remission, is the goal for your RA treatment plan. The various scoring methods look at your lab test results, a count of your tender or swollen joints, and how well you’re able to function on a daily basis, and can help your doctor determine if you are in a low disease or remission state. We’ll talk about remission more later. It doesn’t mean you should stop taking your RA drugs, but you may be able to take lower dosages or take fewer drugs after talking with your doctor.

Your treatment plan will depend on your disease activity score and other factors such as:

- Joint or organ damage
- Other diseases you have, such as liver or lung disease
- Possible reasons that the drug could do you harm and mean you should avoid it
- Your personal preferences, such as drugs that are taken as pills or injections

Based on these factors, your doctor and you may choose to start you on just one drug, which is called monotherapy, or a combination of two or three drugs, called “double therapy” or “triple therapy.”

Side effects are changes that can occur in our bodies as the result of using a particular medication or device. Side effects can be mild or severe and can vary greatly from person to person.

A comorbidity is a condition you have at the same time as your primary condition. Many people with RA have one or more of four common comorbidities: chronic respiratory conditions, diabetes, heart disease, and stroke. This might be a result of the inflammation in RA or because RA can lead to decreased mobility, which can increase the risk of these other health problems.

Contraindications are situations when you should avoid taking a certain medication for health reasons. For example, you should not take DMARD therapy (an RA medication that slows down the progression of your disease. DMARD stands for disease-modifying antirheumatic drug) if you are pregnant; have alcoholism; have alcoholic liver disease or other severe chronic liver disease; have immunodeficiency syndromes such as HIV/AIDS (some patients with HIV can take DMARDS and biologics under careful monitoring), in which your immune system is not working properly (overt or laboratory evidence); or have pre-existing blood dyscrasias (for example, bone marrow hypoplasia, leukopenia, thrombocytopenia, or significant anemia).

If you have active hepatitis A, B, or C, you will need to be treated for that by a liver specialist before you take any drugs for your RA that suppress your immune system or affect your liver. Your liver specialist and rheumatologist can both decide, if once your hepatitis is either stabilized or being treated, that you can start to take certain medications for your RA. But you’ll need to be monitored closely. You may need to come in for blood tests often.

If you have had a previously treated skin cancer, make sure that you are followed closely by your dermatologist as certain RA medication can increase the risk of certain types of skin cancer.

If you have had a previously treated lymphoproliferative disorder, or cancer of any type, you will need to speak with your rheumatologist, as certain RA medications may be better to use in that case. Your rheumatologist may want to speak with your oncologist to figure out the best medication for you.

⚠️ The information in these guidelines should never replace the information and advice from your treating physician. It is meant to inform the discussion that you have with healthcare professionals, as well as others who play a role in your care and well being.
How often should I see my doctor for lab work? Monitoring with blood tests (commonly referred to as “lab work”) is recommended to make sure the treatment that you and your doctor select is both safe and effective. Your doctor may recommend frequent lab work while taking medications for RA, especially when you first start a new medication.

What do my labs mean?
Your lab tests are used to monitor your health during your treatment plan. The most common tests will monitor your liver, your kidney function, and your blood counts.

Liver toxicity is measured with transaminase (AST/ALT) levels. A transaminase is a type of liver enzyme. Your liver can make and release transaminases when it’s injured or weakened in some way. Higher transaminase levels may indicate liver damage.

Creatinine and BUN (blood urea nitrogen) levels are used to assess your kidney function. Even if the RA medication you are taking does not impact the kidney, it is important to keep track of its function because a change in kidney function can affect the level of your RA medicine in your blood. Creatinine is a waste product that your kidneys filter after muscle breakdown and remove through your urine. Your kidneys also remove and flush out urea, a waste product of protein breakdown. If your creatinine or BUN levels are high, it means your kidneys are not able to filter these waste products effectively. They could build up and cause problems.

Complete Blood Count (CBC) testing is done to ensure that you have the right amount of red blood cells, white blood cells, and platelets in your blood. Many medications used to treat RA can affect the bone marrow that makes these blood cells. Active disease may also impact the levels of these cells. It's important to keep these different types of blood cells in balance for good overall health. If your CBC is abnormal, your doctor may change the dose or type of drug you are taking.

Sometimes it might be necessary to measure levels of a medication in your blood to check for toxicity or to make sure you are taking enough of the medication. This test will ensure the drug level in your blood is both effective and safe.

Vectra DA is another type of blood test that can help determine the level of activity of your RA. It is a combination of 12 measurements of different markers in your blood that can point to low, moderate, or high disease activity. High disease activity levels may predict more joint damage in the future. Vectra DA is a new blood test that is not available in all health systems or reimbursement programs.

Imaging
There are various imaging techniques that can monitor the effect of RA on your bones and joints. The most common and widely used technique is the X-ray. More recently, MRI (magnetic resonance imaging) and US (ultrasound) have been used as they can detect smaller changes in the joints earlier than X-ray.
PART SIX

Treatments

Disease-Modifying Anti-Rheumatic Drug (DMARD) Therapy

DMARDs are the most widely used and studied drugs used as therapy for RA.

What is a DMARD?

A DMARD is an RA medication that slows down the progression of your disease. DMARD stands for disease-modifying antirheumatic drug. Other than glucocorticoids (steroids), DMARDs have been on the market the longest and have the most evidence to support their use. The most commonly used DMARD is methotrexate (Rheumatrex®, Trexall®). Another commonly used DMARD is leflunomide (Arava®). Other DMARDs include hydroxychloroquine (Plaquenil®) and sulfasalazine (Azulfidine®). Hydroxychloroquine (Plaquenil) and sulfasalazine (Azulfidine) are often used for milder RA. They are thought to have fewer possible side effects.

METHOTREXATE (TREXALL®, RHEUMATREX®, OTREXUP®, RESUVO®)

What do we already know?

Methotrexate is considered the gold standard in terms of monotherapy treatment of RA with a DMARD, and is generally the first choice.

Methotrexate works by blocking enzymes that help DNA (genetic material in the cells of your body) form or repair. This prevents some cells in your body from reproducing themselves. Experts believe that methotrexate also interacts with your immune system. Although it is not entirely clear how methotrexate works in RA, it’s been proven to be effective in reducing swelling, pain, and long-term damage to joints.

Methotrexate is given once a week as either a pill or shot. Some people have better results with the shot, as the medicine is absorbed differently this way and is better tolerated by people who may have experienced an upset stomach when taking the pill form.

What are the possible side effects of methotrexate?

It’s important to remember that most patients do not experience serious side effects, and for those who do have them, they may improve with time. Side effects are more likely to occur at higher doses and you should always consult your doctor if you think you’re experiencing any of these side effects.

- Gastrointestinal problems, such as nausea, stomach upset, and loose stool
- Mouth ulcers
- Hair loss
- Abnormal liver function blood tests
- Abnormal blood counts
  - Rare side effects include liver cirrhosis or scarring. This usually happens with patients who already have liver problems or are taking more drugs that impact the liver. Lung problems also occur rarely, and typically only with patients who already have lung issues. Report any difficulty breathing or a cough that won’t go away to your doctor. Take these side effects very seriously.
- People with liver disease may not be able to take methotrexate or require closer monitoring or lower dosing.
- Increased skin sensitivity to the sun can also occur, but may stop when the medication is stopped. Supplements like folic acid may help you manage these side effects. If regular folic acid doesn’t help, you may try another type called methylated folic acid. Talk to your doctor about getting methylated folic acid if you still get mouth ulcers, hair loss, or just a “yucky feeling” from your methotrexate. Vitamin A and dextromethorphan (the DM in Robitussin DM) can also be used to help with those side effects.
HYDROXYCHLOROQUINE (PLAQUENIL®)

Hydroxychloroquine (Plaquenil) is often used alone in mild RA or in combination with other medications in people with more severe RA.

What do we already know?

Hydroxychloroquine (Plaquenil) is an antibiotic used to treat malaria, but it also works to treat symptoms of RA, lupus, and other rheumatic diseases. It can reduce your joint pain and swelling. In the long term, it may help prevent joint damage or lower your risk of joint disability.

We don’t really know why this drug works to control RA symptoms or complications. One theory is that hydroxychloroquine (Plaquenil) interferes with communications between the cells of your immune system.

Your hydroxychloroquine (Plaquenil) dose will be based on your weight. Usually, adults with RA will take either 200 or 400 mg of hydroxychloroquine (Plaquenil) per day in pill form.

What are the possible side effects of hydroxychloroquine (Plaquenil)?

Most people tolerate hydroxychloroquine (Plaquenil) well. Some side effects include nausea and diarrhea, but they may lessen over time or if you take your pills with food. Less common side effects are rashes, changes in your skin’s pigment (like dark spots), changes to your hair (like thinning), or muscle weakness.

Although rare, hydroxychloroquine (Plaquenil) use could lead to damage of the cells in the back of your eye that detect light and color. You’ll receive a specialized baseline eye exam when you start the drug. Later, you’ll follow up with your ophthalmologist as directed. The most recent recommendations say you don’t need a follow-up eye exam for five years, but you may need one sooner depending on your other medical conditions or if you have changes in your vision while taking hydroxychloroquine.

Hydroxychloroquine seems to be safe during pregnancy, but any time you are considering pregnancy you should discuss all medications with your doctor.

Other rare side effects of hydroxychloroquine (Plaquenil) are:

- Anemia, especially in people with porphyria
- Muscle weakness

LEFLUNOMIDE (ARAVA®)

Leflunomide (Arava) is used to treat moderate to severe RA. It can lower joint damage and disability that RA can cause. It can also help ease your symptoms. It may be used alone or in combination with other DMARDs.
**What do we already know?**
Leflunomide (Arava) blocks the development of certain cells in your immune system. By doing this, leflunomide (Arava) works to suppress your immune system and reduce inflammation that causes pain, swelling, and other symptoms.

The typical dose of leflunomide (Arava) is one 20 mg pill a day. Some people may take 10 mg a day, especially if the higher dose causes side effects. You should take your leflunomide (Arava) with food.

Your doctor may prescribe a “loading dose” of leflunomide (Arava) for you, which means you'll be prescribed extra drug in the beginning to give the medication a chance to build up in your body and become effective. Because of the possibility of increased side effects with a loading dose, most rheumatologists do not use loading doses of leflunomide (Arava). Without the loading dose it may take a little longer (six to twelve weeks) to notice a benefit from leflunomide (Arava).

One of the side effects of leflunomide (Arava), like methotrexate, is the potential for liver toxicity. So you shouldn’t drink alcohol or take certain medications while you take leflunomide (Arava). If you've had significant liver disease in the past, leflunomide (Arava) may not be right for you. You'll need regular liver function blood tests to make sure your liver is healthy.

Leflunomide (Arava) can also be harmful to an unborn fetus. It can cause serious birth defects, so you should take extra precautions not to get pregnant while taking this drug. **Because leflunomide (Arava) can stay in your system anywhere from 10 weeks to 2 years, it is important to get a blood test to see if the drug is still in your blood before even trying to get pregnant.** Breastfeeding should be avoided as well, unless leflunomide (Arava) is completely out of your system. Men who take leflunomide (Arava) should also use birth control to avoid getting their partner pregnant because of the birth defect risk.

**What are the possible side effects of leflunomide (Arava)?**
The most common side effect of leflunomide (Arava) is diarrhea. It often gets better over time. You can take anti-diarrheal medicines to ease this side effect, or even lower your leflunomide (Arava) dose.

Other side effects include nausea, indigestion, hair loss, stomach pain, liver toxicity, or skin rashes. More rarely, this drug may lower your amount of blood cells or platelets, or cause lung problems like cough or shortness of breath.

Leflunomide (Arava) may also raise your risk of getting infections. Let your doctor know if you have signs of an infection, like fever or chills.

---

**SULFASALAZINE (AZULFIDINE®)**
Sulfasalazine (Azulfidine) is used to treat RA symptoms like pain or swelling. Over time, it can help slow down the progression of your disease. It may be used alone or in combination with other DMARDs.

**What do we already know?**
Sulfasalazine (Azulfidine) is part of a class of medicines called sulfa drugs. It's a mix of salicylate, which is the main ingredient in aspirin, and an antibiotic. Some people are allergic to all sulfa drugs, so they can't take sulfasalazine (Azulfidine).

We don’t know exactly why sulfasalazine (Azulfidine) eases RA symptoms like pain, swelling, or joint stiffness. It may prevent joint damage and over the long term, loss of your joint function.

Most people take two 500 mg tablets of sulfasalazine (Azulfidine) twice per day. Some people may start with a
lower dose, such as one or two tablets per day, then build up to the normal dose. Some people may need six 500 mg tablets per day.

You should take your sulfasalazine (Azulfidine) with food and a full glass of water to help ease stomach side effects. You shouldn’t crush or chew up your sulfasalazine (Azulfidine) tablets.

Sulfasalazine (Azulfidine) should be safe to take during pregnancy but, as always, you should check with your physician if you are planning a pregnancy. It may be necessary to take extra folic acid if you continue on sulfasalazine during pregnancy. However, using it during breastfeeding may cause a serious type of jaundice in babies.

If you have an infection, your doctor may have you stop taking sulfasalazine (Azulfidine).

What are the side effects of sulfasalazine (Azulfidine)?
Most people have few side effects with sulfasalazine (Azulfidine). The most common ones are nausea, stomach upset, and headache. Usually, this gets better over time. You can take a coated sulfasalazine (Azulfidine) pill that may be easier to digest.

Rarer side effects include headache, skin rashes, itching, mouth sores, or liver or lung problems. If you get a severe rash, tell your doctor.

Treatment Changes
What if the monotherapy doesn’t work? What next? If your RA disease activity remains moderate or high despite DMARD monotherapy, another DMARD agent, biologic agent, or JAK inhibitor may be added to your DMARD.

Combination Therapy
Everyone is different. In some cases, methotrexate or hydroxychloroquine (Plaquenil) might not work by itself or at all. In those cases, a doctor will discuss the following with you:

- **Double therapy**: Double therapy is the use of two different medications, usually methotrexate and another DMARD, such as leflunomide, sulfasalazine, or hydroxychloroquine.
- **Triple therapy**: Triple therapy uses three medications instead of two. Monitoring for both triple and double therapy is similar to monitoring for DMARD monotherapy. Closer monitoring, initially, may be warranted depending on the combination of medications.

Sometimes, combination therapy will include the use of a biologic. Evidence shows that more aggressive treatments are associated with better control of the disease, slower radiological progression (meaning that your X-rays or imaging scans show that your joint damage is slowing down), and improved functional outcomes. There are many combinations of medications, although there is uncertainty around which is the most effective.

It’s up to your doctor to decide which medication combination is best for you. In general, combination therapy is well tolerated, but needs to be monitored closely for any increased side effects. As always, there is a risk for infection in people who are using DMARD and biologic therapy. Alert your doctor if you notice any sign of infection, such as fever, chills, or flu-like symptoms.

**Biologics**
**Biologics** are a newer type of medication produced by living cells. They’re designed to act like the proteins that are already in your body. They target specific areas of your immune system. Because they’re so specific, they can cause fewer side effects than DMARDs. Infection is one possible side effect of biologics. Your rheumatologist will
Treatments

watch you closely for any signs that you have an infection. Biologics can be used alone or in combination with methotrexate or another DMARD. Due to their specificity, if one biologic fails, another may work for you. Keep the dialogue open with your doctor in the case that you may need to switch.

TNFi BIOLOGICS

These biologics work by targeting something called tumor necrosis factor proteins, or TNF. TNF is a protein that sends signals to your body, eventually leading to inflammation that causes swelling, pain, and stiffness. By inhibiting, or stopping, TNF, these medications can reduce inflammation. That's why they're often called TNF inhibitors (or TNFi).

Some common TNFi biologics are adalimumab (Humira®), certolizumab pegol (Cimzia®), etanercept (Enbrel®), golimumab (Simponi®, Simponi Aria®), and infliximab (Remicade®).

These biologics are molecules that are specially designed to target TNF and block it at the source. They can cool down your immune response that’s out of control in RA.

Your doctor may prescribe TNFi biologics if previous DMARD monotherapy was ineffective. Personal considerations such as out-of-pocket cost, comorbidities, and side effects may make TNFi therapy (often with the addition of methotrexate) the best option.

For individuals with established RA, TNFi biologics could be an addition to your DMARD monotherapy or double therapy, or used alone. Your rheumatologist will determine which option is best for you based on your personal medical history.

Make sure you have a talk with your physician about why a certain treatment option is best for you. Treatments like TNFi are very case-specific.

How do I take my TNFi biologic?

You may be able to give yourself this medication, via injections, at home (known as “self-injection”), or via an infusion in the doctor’s office or other infusion site. A healthcare professional will indicate where on your body it is safe to administer these injections (usually the upper leg or stomach). Make sure to rotate the injection sites. If you have psoriasis, do not inject in affected areas. If you’re afraid to inject yourself, talk to your nurse, clinic staff, or pharmacy about having someone there give you these shots.

Be sure you are confident on how to do this procedure before you administer the medication on your own. Don’t be afraid to ask for help!

You may also get your biologic as an infusion instead of a shot. A healthcare professional gives you the drug through an IV. You’ll get your treatment in your doctor’s office, at a special infusion center, or at your local hospital. You and your doctor can decide if an infusion is the right option for you. The infusions can last as little as 30 minutes, or could take up to several hours — depending on the drug, dose, and individual.

Adalimumab (Humira) is given as a 40 mg self-administered subcutaneous (under the skin) injection every other week.

Certolizumab pegol (Cimzia) is given as a subcutaneous injection of 400 mg on weeks 0, 2, and 4, followed by 200 mg every two weeks or 400 mg every four weeks. Cimzia can also be given in a lyophilized (dehydrated and freeze-dried) formula that is given in the doctor’s office.

Etanercept (Enbrel) is given as a 50 mg self-administered subcutaneous injection every week or 25 mg self-administered injection twice weekly.

Golimumab (Simponi) is given as a 50 mg self-administered subcutaneous injection once monthly.
Golimumab (Simponi Aria) is given via IV infusion in the clinic or infusion center on weeks 0 and 4, followed by IV infusion every eight weeks. Dose is based on weight.

Infliximab (Remicade) is given via IV infusion in the clinic or infusion center at weeks 0, 2, and 6, then by infusion every four to eight weeks. Dose is based on weight.

The benefits of TNFi inhibitors are usually seen within a few weeks (but can take up to four to six weeks), unlike DMARDs, which can take up to a few months to have their effects.

**Side Effects**

Side effects of TNFi's might include injection site reactions, upper respiratory infections, laboratory abnormalities, and headache. The likelihood of experiencing these and any side effects vary from individual to individual, and should always be discussed with your doctor before beginning treatment.

Infliximab has been associated with the development of antinuclear and anti-double stranded DNA antibodies, nausea, abdominal pain, and infusion reactions. Serious side effects include increased risk of infection, especially tuberculosis and fungal infections. Untreated hepatitis B may worsen while taking TNFi's. You should be tested for TB and hepatitis before starting one of these medications. Less common side effects include allergic reaction and development of other immune system disorders. If you have had cancer of any type, or have an increased risk, you will need to discuss the various options with your rheumatologist regarding the use of any biologics.

If you think that you might have an infection, check with your doctor before taking your drug. Biologic drugs make it harder for your body's immune system to fight off infections. They may even make it harder for you to spot the early signs of infection, so talk to your doctor about what to look for.

For more information, go here: [http://www.rheumatology.org/I-Am-A/Patient-Caregiver/Treatments/Anti-TNF](http://www.rheumatology.org/I-Am-A/Patient-Caregiver/Treatments/Anti-TNF)

If you're planning to have surgery, talk to your rheumatologist first. You may need to go off your biologic for some time before you have the surgery.

**Contraindications**

Live and attenuated live vaccines, such as the shingles vaccine, yellow fever vaccine, and Flumist® (intranasal flu vaccine), should not be given when taking a TNFi biologic. These medications can interact with vaccines and certain foods and medications. Make sure you talk to your doctor about current medications, planned vaccinations, and any diet changes you make (use of vitamins, herbal products).

Adalimumab (Humira) specifically interacts with blood thinners (i.e. warfarin (Coumadin®)).

**Existing Conditions**

**Congestive Heart Failure (CHF):** TNFi biologic therapy is not recommended for patients living with uncontrolled CHF, as it can lead to a worsening of this condition.

**Previous Serious Infection:** TNFi drugs have been found to increase the incidence of pneumonia, tuberculosis (TB), certain fungal diseases, and skin/soft tissue infection. You will be required to be tested for TB before starting any biologic drug.

**Hepatitis C without Receiving Antiviral Therapy:** The ACR recommends that your physician speak with a gastroenterologist and hepatologist to consider the management of these two disease states. TNFi can be carefully administered while managing treatment of hepatitis C.

**Previously Treated Lymphoproliferative Disorder:** TNFIs can increase your chances of lymphoma. As an increased risk of lymphoma in RA patients taking TNFIs compared to a non-RA population has been shown in studies, these biologics are not recommended for patients with a previous history of lymphoproliferative disorders.
People who have or have had multiple sclerosis should not take TNFi drugs.

Be sure to tell your doctor if you are: pregnant or breastfeeding and/or have kidney or liver disease, cancer, CHF, blood or bone marrow problems, or any type of infection. Also mention any nervous-system problems such as Guillain-Barré syndrome or multiple sclerosis. They may indicate that you should not be on TNFis.

When starting most biologics, you'll need to take frequent blood tests to monitor the drug's effects. Once you're established on a biologic, however, your tests will become less frequent. Specifically, for TNFi biologics, blood tests will be done to check bone marrow suppression, a low white blood cell count, or effects on the liver.

OTHER BIOLOGICS

What do we already know?
There are other biologics that target the immune system in different ways from TNFi drugs. They interact with different kinds of white blood cells, such as T cells or B cells, in your immune system. They can also block chemicals called cytokines that cause inflammation.

White blood cells and cytokines are made by your immune system to fight off infection. But in RA, they may be out of control and cause inflammation. So these drugs can suppress your immune system, ease inflammation, stop RA's progress, and ease your symptoms.

What do the recommendations say?
If disease activity remains moderate or high despite use of DMARD therapy, biologics that target the immune system in different ways from TNFi drugs or a JAK inhibitor may be added to the DMARD or used alone without a DMARD, depending on the drug.

Why am I prescribed a biologic?
Your doctor may prescribe a biologic if previous DMARD monotherapy was ineffective. Personal considerations such as out-of-pocket cost, comorbidities, and side effects may make a biologic (often with the addition of methotrexate) the best option.

How will I take my biologic?
You may be able to give yourself this medication, via injections, at home (known as “self-injection”), or via an infusion in the doctor’s office or other infusion site. A healthcare professional will indicate where on your body it is safe to administer these injections (usually the upper leg or stomach). Make sure to rotate the injection sites. If you have psoriasis, do not inject in affected areas. If you’re afraid to inject yourself, talk to your nurse, clinic staff, or pharmacy about having someone there give you these shots.

Be sure you are confident on how to do this procedure before you administer the medication on your own. Don’t be afraid to ask for help!

You may also get your biologic as an infusion instead of a shot. A healthcare professional gives you the drug through an IV. You’ll get your treatment at a special infusion center, in your doctor’s office, or at your local hospital. You and your doctor can decide if an infusion is the right option for you. The infusions can last as little as 30 minutes or could take up to several hours — depending on the drug, dose, and individual.

Some common biologics that work differently than TNFi biologics:
Abatacept (Orencia®), rituximab (Rituxan®), or tocilizumab (Actemra®)

Side Effects
As with all biologics, the greatest risk while taking these drugs is infection. Notify your doctor immediately if you
experience the signs of infection: fever, chills, or nausea.

**Abatacept (Orencia):** Abatacept works by blocking signaling to a special kind of white blood cell called a T cell. The most common side effects of abatacept (Orencia®) are headaches, colds, sore throats, nausea and in children, diarrhea, cough, fever, and abdominal pain. In rare cases, allergic reactions, hives, shortness of breath, or low blood pressure may occur. Serious side effects such as infections may occur. You should not receive a live vaccine while on abatacept (Orencia®). Abatacept can be given by IV infusion or self injected.

**Tocilizumab (Actemra):** Tocilizumab works by blocking a cytokine known as IL-6 that can cause inflammation. Rare reactions include fever and chills and increased risk of infection. Increased cholesterol levels and/or an increase in liver enzymes may also occur. A very rare complication that may occur is bowel perforation, or a hole in the bowel wall. Notify your doctor immediately if you have a history of diverticulitis, develop abdominal pain, or have bloody bowel movements while taking tocilizumab (Actembra®). Tocilizumab can be given by IV infusion or self-injected.

**Rituximab (Rituxan):** Rituximab works by blocking a special kind of white blood cell known as B cells. Some patients can feel side effects during or up to 24 hours after receiving rituximab (Rituxan®). They can include mild throat tightening, flu-like symptoms, rash, itchiness, dizziness, and back pain. In rare cases, patients may experience wheezing, mouth or throat swelling, trouble breathing, or chest pain. Other side effects may include headache, cough, nausea, upset stomach, sweating, nervousness, muscle stiffness, and numbness. In very rare cases, a severe skin reaction, mouth sores, vision changes, loss of balance, difficulty walking, or confusion may occur. Contact your doctor immediately if you experience these. Rituximab is given by IV infusion.

Some side effects can be reduced by taking a steroid injection before your rituximab (Rituxan®) infusion, or by taking acetaminophen (Tylenol®) or diphenhydramine (Benadryl®). Sometimes an infusion may be stopped and then restarted at a slower rate to ease the frequency of side effects.

**How to Monitor**
You may have to undergo regular blood testing while on a biologic. Blood tests are also used to measure liver and kidney function, as these are the organs that process what goes through your body. Complete blood counts (CBCs) are tests that measure your bone marrow health and immune cells. This is checked when you get your blood drawn while you’re taking these drugs. By monitoring your blood, your medical team is able to ensure that your body can fight infection without causing the pain, stiffness, and swelling of arthritis.

Again, it’s important for you to watch for any signs of infections, like coughs, discomfort when you urinate, or if you have cuts that aren’t healing. If you have any of these signs in between your doctor’s visits, let your doctor know before you take your next biologic dose.

**Contraindications**
With all of the biologics there are times when these medications should not be used. Some of these situations include a history of recurrent life-threatening infection, untreated tuberculosis or other active infection, history of lymphoma (except for rituximab), active demyelinating disease (MS), or active hepatitis B.

**Existing Conditions**
**Previously Treated or Untreated Skin Cancer (Non-Melanoma or Melanoma):** These biologics are not contraindicated in this condition, but it’s very important to have careful monitoring by a dermatologist.

**Comorbidities**
Chronic respiratory conditions, diabetes, heart disease, and stroke. Talk with your doctor if you have any of these comorbidities. In some cases, medications to treat these conditions may interact with your biologics. It is important that your doctor is giving you the proper treatments for your health concerns.
For more information on biologic drugs, go here: http://www.rheumatology.org.uk/includes/documents/cm_docs/2015/b/biologicdrugs.pdf

Janus Kinase (JAK) Inhibitors

JAK inhibitors are a new class of arthritis drugs that treat RA. They’re not biologics. They are known as small molecule medications.

JAK inhibitors come in pill form. They decrease your immune system’s ability to make certain enzymes that can lead to RA symptoms. The first JAK inhibitor is tofacitinib (Xeljanz®). Many others are being developed now, and may be approved soon.

JAK inhibitors can be used with or without methotrexate. Your rheumatologist may even prescribe this drug before you try a biologic if he or she thinks it's the right option for you.

TOFACITINIB (XELJANZ®)

Introduction
Tofacitinib (Xeljanz) is used to treat RA in patients who cannot tolerate methotrexate. It’s one of a newer class of arthritis drugs called janus kinase (JAK) inhibitors.

What do we already know?
Tofacitinib (Xeljanz) works by decreasing the effectiveness of the immune system to reduce pain, swelling, and inflammation.

What do the recommendations say?
According to the ACR's RA treatment guidelines, “the voting panel strongly recommended the use of tofacitinib (Xeljanz) for patients with established RA with moderate or high disease activity despite DMARD monotherapy.”

Why am I taking this medication?
Your doctor may prescribe tofacitinib (Xeljanz) if you are not able to tolerate methotrexate, or if you have taken methotrexate without any result. You may be taking tofacitinib (Xeljanz) alone or in combination with another drug.

How do I take this medication?
Tofacitinib (Xeljanz) comes in tablet form. It can be taken once or twice a day, usually without food. You should take tofacitinib (Xeljanz) at the same time every day. It is a good idea to read the label carefully and talk with your doctor to make sure you fully understand how to take your medication.

There are two forms of tofacitinib (Xeljanz), although both are tablets. Extended-release tablets typically have 11 mg of medication and are taken once a day. They are broken down differently by your body, and release the product at a slower rate. Rapid release tablets typically have 5 mg of medication and are taken twice a day. They are broken down quickly and release the product much faster.

When will it start to work?
With tofacitinib (Xeljanz), you may start to see an improvement in your symptoms in as little as two weeks. However, it typically takes up to three to six months to reach full effectiveness.

When to Talk to Your Doctor
Talk to your doctor if you experience any of the following:
Treatments

- Negative reactions or side effects
- Concerns about why you have been prescribed this drug
- Your symptoms do not improve within six months
- Questions or confusion about your medication usage
- If you are planning surgery
- If you are planning on missing your dose for any reason
- Possible signs of an infection like chills or nausea
- Fever
- If you may be pregnant

Side Effects
Many patients do not experience side effects, and those who do rarely experience serious side effects. Many side effects become less serious and frequent over time. Some less serious side effects include:

- Nausea
- Indigestion
- Diarrhea
- Headaches
- Upper respiratory tract infection
- Increased cholesterol levels

In rare cases, more serious side effects can occur, such as:

- Infection
- Abnormal blood counts
- Abnormal liver function tests
- Increased risk of bowel perforation
- Decrease in kidney function

Taking your medication as prescribed by your doctor, getting your blood regularly monitored, and attending all your medical appointments will reduce the occurrence and seriousness of any side effects.

How to Monitor
While you are taking tofacitinib (Xeljanz), you will need to get periodic blood tests so your doctor can monitor different values. This is to ensure that the medication is working effectively and to keep track of whether or not there are any negative side effects.

**Lymphocyte count:** You’ll need this test once before you begin taking tofacitinib (Xeljanz) to note your “baseline,” and then every three months after. Lymphocyte counts are used to measure your white blood cells. White blood cells are an important part of your immune system. Lymphocyte counts are used to determine whether or not the medication is working, and to make sure that your immune system can still prevent you from getting an infection. If your lymphocyte count is too low, your doctor may change your dosage or medication.

**Neutrophil/platelet counts:** You’ll need this test once to note your baseline, once after four to eight weeks, and every three months after. Neutrophil counts measure another type of white blood cells, and so they are monitored as another way to ensure your medication is working and not causing harm. Platelets are also a part of your immune system, but control your blood’s ability to clot. If you have too few, there is a risk for unusual bleeding. If your blood work shows too few platelets or neutrophils, your doctor may adjust your dosage or medication.

**Hemoglobin:** You’ll need this test once to note your baseline, once after four to eight weeks, and every three months after. Hemoglobin is a part of your red blood cells, and helps carry oxygen in your bloodstream. Too little hemoglobin can lead to increased abnormal bleeding. Monitoring can reveal whether or not you are at risk for
bleeding, and if your hemoglobin is too low, your doctor may adjust your medication.

**Lipids:** You'll need this test four to eight weeks after you begin taking the medication and periodically afterward. Lipid levels are measured to ensure that tofacitinib (Xeljanz®) is not having a negative effect on your cholesterol levels.

**LFTs:** LFTs, or Liver Function Tests, should be done periodically to ensure that liver damage does not occur.

**Viral Hepatitis:** Prior to starting your medication, you should be tested for viral hepatitis. You should not take this drug if you are positive for viral hepatitis.

You will also need to have your heart rate and blood pressure periodically monitored, as well as skin tests, and signs and symptoms of any potential infections. This is to ensure that you’re not having any negative side effects. If you have any potential harmful impacts from taking this drug, your doctor may adjust your dosage or medication.

### Contraindications
Contraindications for tofacitinib (Xeljanz) are: having a history of a reaction to tofacitinib, pregnancy, some liver disease, some kidney disease, blood disorders, some cancers, active infections, or a history of active tuberculosis.

### Comorbidities
Talk with your doctor if you have any of these comorbidities: chronic respiratory conditions, diabetes, heart disease, or stroke. In some cases, medications to treat them may interact with tofacitinib (Xeljanz), and it is important your doctor is giving you the proper treatments.

---

### GLUCOCORTICOIDs

**Introduction**
Glucocorticoids are medicines used to reduce inflammation. They may also be called corticosteroids or even “steroids” for short. The most commonly prescribed glucocorticoids are prednisone and methylprednisolone (Medrol®).

**What do we already know?**
These medications can reduce RA symptoms very quickly. They’re often used as a “bridge therapy” while you’re waiting for your DMARD or biologics to kick in. They can also be used if you have a flare and need quick symptom relief.

Glucocorticoids are designed to act the same way as the hormones (natural steroids) made by your adrenal glands that sit on top of your kidneys. They can suppress inflammation and make your immune system less active. Increasing the dosage to more than 6 mg per day can also raise the likelihood of side effects.

**Why am I taking a glucocorticoid?**
More than likely, you are taking glucocorticoids short term to help treat joint pain and swelling during a flare or while you’re waiting for your DMARD or biologic drug to take effect. Sometimes, none of your other medications reduce your symptoms enough, so you add a low dose of steroids. Because steroids have side effects, it’s best to take the lowest possible dose you need to ease your symptoms. You should never suddenly stop your steroids if you have been taking them for longer than two weeks, unless you have tapered to a low enough dose as directed by your doctor.

**What are the possible side effects of glucocorticoids?**
- Increased infection risk
- Diabetes
Treatments

- Hypertension
- High blood pressure
- Weight gain
- Osteopenia and osteoporosis (thinning or weakened bones)
- Glaucoma or cataracts in your eyes
- Acne
- Roundness of the face or “moon face”
- Nervousness and inability to sleep (particularly if you take it at night)

Your chances of having these side effects depend on your dose, how long you take glucocorticoids, or if you have other medical conditions.

How to Monitor
You and your doctor should be on the lookout for any of the above side effects. If you have these, you may need to adjust your steroid dose. If you have diabetes you will need to check your blood sugar more often and may have to adjust your medication, as steroids can increase your blood sugar. Your doctor will review your use of glucocorticoids often. You probably won’t need to keep taking these drugs for very long.

How can I reduce the side effects?
Here are some steps you can take to lower your risk of side effects from glucocorticoids:

- Increase your calcium and vitamin D intake, and do weight-bearing exercises to protect your bones. You may need to take a medicine to protect your bones if you remain on steroids for a long time.
- Eat plenty of green, leafy veggies, and lower your intake of sugar and salt to prevent weight gain, diabetes risk, and high blood pressure.
- Cut back on or quit smoking and drinking alcohol to boost your bone and heart health.

On the Horizon: New Drugs Coming Down the Pipeline

There are many new drugs that are being tested now and some will be up for FDA approval next year. Many are still in clinical trials. That means researchers are still testing them to see if they work well to control inflammation, arthritis symptoms, and disease activity; to make sure they are safe for you to take; and to make sure that they don’t have side effects that would outweigh the possible health benefits of the drug.

Clinical trials happen in hospitals, clinics, universities, and even in your doctor’s office. Patients like you can take part in clinical trials if you meet the qualifications the researchers need to test the drug. There are four phases of clinical trials for a drug:

- **Phase I Clinical Trial:** A new drug is tested on a very small group of patients to see if it’s safe, how much dosage of the drug is needed to work effectively, and the side effects the drug may cause.

- **Phase II Clinical Trial:** The new drug is then tested on a larger group of patients to make sure it is effective and safe.

- **Phase III Clinical Trial:** The drug is given to much larger groups of patients to further ensure it’s safe and effective in different situations, to look for side effects, to compare it to other drugs that are available for the same condition, and to gather any information that will be needed so the drug can be safely given.

- **Phase IV Clinical Trial:** After the drug is approved and available for prescription, or on the market, more trials are done to test its long-term effectiveness, possible side effects, or how it works in different patient groups.

There are several additional JAK inhibitors still in clinical trials and, if they’re approved by the FDA, will one
Treatments

day be available for prescription for RA. Not all of them have specific names yet, but they may soon have them. If they're approved, each drug will have a new “brand” name — which is the name with the ® after it.

**Phase III Clinical Trials (as of October 2016):**
- Baricitinib
- Filgotinib
- Peficitinib
- ABT-494

**Phase II Clinical Trials (as of October 2016):**
- Decernotinib
- INCB-039110

Additional clinical trials may be available. For a complete list of clinical trials, including eligibility information from the individual sponsors of the clinical trials, go to: [http://www.ClinicalTrials.gov](http://www.ClinicalTrials.gov)

---

**RAISE YOUR VOICE:** Patients just like you take part in clinical trials of arthritis treatments, including drugs not yet available to the public. These trials can help rheumatologists and drug manufacturers learn more about these treatments, including their effectiveness and possible side effects. If you're curious about clinical trials and whether they may be right for you,** ask your rheumatologist.** He or she may be conducting clinical trials or know of current trials looking for patients like you. You may also learn more about current RA clinical trials at [www.clinicaltrials.gov](http://www.clinicaltrials.gov), or see advertisements online, and in major magazines and newspapers. Ask about all the possible risks of any clinical trial before you proceed, and also ask about any costs you may have to take on to be in a trial, including travel or time away from work.

---

**BIOSIMILARS**

There’s another new option that will soon be available to treat RA: biosimilar drugs. These are very similar copies of the various biologics that are already on the market. You may have seen this term in the news, or even heard your doctor or nurses mention it. Biosimilars are drugs that are made to be very similar to existing biologic drugs like TNF inhibitors.

Biosimilars are not exactly like **generic** drugs, which are exactly the same as the original, brand-name drug, but usually cheaper. But because they use already-completed research to be developed, biosimilars are designed to take less time and clinical trial data to approve, and **should** be cheaper than the original biologic drug. Biosimilars’ names include the original drug’s generic name and a four-letter suffix to distinguish it. Once approved, biosimilars should have registered (*) brand names of their own.

In 2016, three biosimilars to biologics used to treat RA have been approved by the FDA so far:
- Infliximab-dyyb (Inflectra®)
- Etanercept-szzs (Erelzi®)
- Adalimumab-atto (Amjevita)

More biosimilars to biologics used to treat RA are in development now. Due to patent exclusivity held by the innovator drug manufacturers, biosimilars may not be immediately available. There are ongoing challenges to patent rights that are currently in the court system to determine when the particular biosimilar will be permitted to be sold.
Treatments

Biosimilars will be taken in the same way as their reference drug, and have the same possible side effects, contraindications, and monitoring tests. All biosimilars have to meet the same standards of safety and efficacy as any other prescription drug approved by the FDA. But because they cost less to develop and test, they may not be quite as expensive as other biologics. However, biosimilars are not identical to the original drug — they’re just highly similar.

Each state has different laws about how biosimilars may be substituted for their reference biologic when a prescription comes to the pharmacy. If you have any concerns, talk to your doctor about your state’s rules. More than 35 states have passed laws so far that require pharmacies, including mail-order specialty pharmacies, to notify doctors if they plan to substitute a biosimilar for the reference biologic. Physician associations, pharmacists’ groups, the FDA, pharmaceutical companies, and others are still debating these issues.

In the future, there are expected to be biosimilars that are so close to their reference biologics that the FDA will designate them as interchangeable. There are no interchangeable drugs in development yet, and the FDA has not even established the criteria for designating a drug as “interchangeable.”

When and if a drug is given the interchangeable tag in the future, pharmacists may be able to substitute that drug for the original reference biologic when they fill a prescription from a rheumatologist.

RAISE YOUR VOICE: Biosimilars for RA are being approved by the FDA now, and more are on the way soon. These drugs will offer you more options to treat your RA, control inflammation, and ease symptoms. The first step to take is to ask your rheumatologist if there’s a biosimilar available that’s right for you. Start a conversation with your doctor about biosimilars to your current RA biologic drug, and what potential risks, benefits, or savings you may have if you switch. Call your insurance company to find out if a biosimilar to your current RA biologic is on their formulary, and how much the biosimilar may cost for you. Information is power. You deserve clear, simple information — including side effects, risks, benefits, and out-of-pocket costs — for all your treatment options. Once approved by the FDA, biosimilars’ manufacturers will also have websites that tell you more about these treatments and patient assistance programs, which may offer you discounts and savings.
Non-Pharmacological Treatments

I. INTEGRATIVE MEDICINE AND COMPLEMENTARY THERAPIES

Although there isn’t a great deal of solid, scientific evidence to support many complementary and alternative medicine (CAM) therapies for arthritis, many people feel that using them in addition to your prescriptions could have some benefits. Before actively engaging in integrative medicine or complementary therapies, consult with your doctor. Here are some common CAM therapies used by people with RA:

- Exercise
- Tai Chi and Yoga
- Acupuncture, possibly cupping
- Massage therapy
- Magnetic therapy, copper bracelets
- Relaxation therapy or meditation
- Hydrotherapy, sauna treatment
- Nutrition, dietary herbs and supplements
- Physical therapy
- Aquatic exercise
- Weight management
- Osteopathic manipulation
- Chiropractic adjustments

Exercise is the most recommended therapy for arthritis. Be sure to ask your doctor about the safety of any CAM, even exercise, before starting it to make sure it is right for you.

**Exercise Tips for When You Have a Flare**

Listen to your body. Don’t do anything that adds more pain and discomfort, or could cause an injury. If you can do some kind of movement even during your flare, you may find that it can help. Break up your exercise routine into shorter segments. Or do something light that just gets you moving. Water exercise may be a good option during a flare, because you can move your joints without putting pressure on them.

Exercise or regular physical activity can help curb the symptoms of RA, including pain, stiffness, and lack of mobility. How do you get started? What kinds of exercise work best? It really depends on your symptoms, your overall fitness and health, and what kind of exercise you might like to do the most — because if you like doing an exercise, you’re more likely to keep doing it.

In the past, doctors told people with RA not to exercise. They thought exercise would damage fragile joints. But now, we know that exercise is safe and healthy for people with RA. It’s not likely to make your disease flare or cause more joint pain, especially if you do it in moderation. So start slowly with any new exercise you try, and then work up to longer or more challenging routines. Weightbearing exercise is particularly important if you have taken courses of steroids for a long period of time or multiple times a year, to enhance your bone density and balance.

Talk to your doctor before starting any new exercise routine so you know that it’s safe and healthy for you. You might start with something as simple as walking, or try working out in a heated pool at your local community center or gym. You can take local exercise classes that are designed for people with arthritis so you don’t damage or injure your joints.

Here are a few suggested exercise options for people with RA:
**Stretching**

Daily stretching can help you manage your arthritis pain and improve your range of motion. After a three to five minute warm up (marching in place or arm circles), perform a variety of stretches and hold each for about 15 seconds. Reaching for the sky and touching your toes are good places to start. Don’t be afraid to stretch any joints that tend to be problem areas. Listen to your body — don’t push any stretch so far that it causes pain.

**Walking**

This simple exercise can fit easily into your daily routine no matter how old you are or where you live. It’s free — just find a safe place to walk in your area and get moving. Find some friends, neighbors, or family members to join you for a walk to make it even more fun. Walking can be good for your heart health, joint health, and mood.

If the weather is bad, you can walk inside your local mall. If it’s a pretty day, explore your neighborhood or local park. Walk on flat, paved surfaces to be safe. Make sure you have well-fitting, comfortable walking shoes and socks. Wear comfortable clothing that you can work up a sweat in. Drink some water beforehand or bring a small bottle so you don’t get dehydrated.

Start slowly and walk at an easy pace. As you feel more confident, challenge yourself to walk a little faster or farther, or both. Some people like to use personal fitness tracking devices (i.e. a FitBit or a pedometer) to track their daily activity and encourage consistent exercise.

**Tai Chi and Yoga**

Tai chi and Yoga are two ancient forms of movement. Tai chi is a series of flowing movements designed to help you improve function and balance. Yoga, which comes in many different styles, usually involves poses and stretches that are meant to improve arthritis symptoms and mood.

Both tai chi and Yoga are used by many people with RA to feel better and improve some of their RA-related
Treatments

symptoms. Done properly, both tai chi and yoga can be safe for people with arthritis to do on a regular basis. There are a number of arthritis tai chi and Yoga programs in local communities, as well as videos and online instruction tools.

You can also take a class from an instructor who can show you how to adapt your moves to be safe for your joints. Talk to your doctor or physical therapist to find out if tai chi or Yoga are right for you, and if they recommend any classes in your area.

Aquatic Exercise
Exercising in water is great if you have RA, because water’s buoyancy supports your weight so you can move around without putting lots of pressure on your joints. But water also offers some resistance as you move, so it can help you work your joints and muscles, and get stronger. Check out water exercise classes in your area, especially ones designed for people with arthritis. Your doctor or physical therapist can refer you to the right water exercise classes in your community.

Biking
People with RA have a higher risk of cardiovascular disease because of the inflammation involved in the disease. Riding a bike, either stationary or regular, can help rev up and strengthen your heart. It can also help you ease stiffness, improve range of motion or flexibility, and build endurance and muscle tone.

Strength Training
You can relieve the stress on joints damaged or weakened by RA if you build up the muscles around them. Strength training is the best way to do that. You can do specific exercises that target those muscles on your own, on a weight machine, or with small free weights. It’s important to do any strength exercises the right way, so talk to a physical therapist. Your PT can recommend strengthening moves for you and show you how to do them properly.

Acupuncture
This ancient healing practice uses thin needles that are inserted into specific points on the body. Acupuncture is meant to help balance your body’s natural energy flow (also known as ‘qi’). Its effects can ease your pain, increase a sense of calm, and improve digestion, to name a few possible benefits. Risks are typically mild, including transient lightheadedness, pain at needling site, initial exacerbation of symptoms, and bleeding. Acupuncture should ideally be performed by a licensed acupuncturist (LAc) who has completed a master’s degree or higher level of training. Acupuncture sessions are typically performed once or twice a week. At least six to ten sessions should occur before you decide on its effectiveness and whether to continue therapies. Insurance coverage varies for this therapy, so check with your carrier to learn if you have coverage for acupuncture. Recent research shows that acupuncture may have some benefits for people with chronic pain:

Massage Therapy
Performed by massage therapists as well as other health professionals, massage involves pressing or kneading muscles and tissues in a relaxed, quiet environment. The most common type is Swedish massage. Recent studies have shown pain-relief benefits for Swedish massage, including for knee osteoarthritis. Massage therapy can relieve anxiety, which helps ramp down the pain response as well.

Magnet Therapy and Copper Bracelets
Magnets produce a field of energy that attracts metal, just like the ones you use to stick notes on your refrigerator. Magnets are used as an alternative therapy for pain relief in arthritis, and may be sold as products like socks, bracelets, mattress pads, or bands that you strap around your painful joints. However, there’s no evidence that magnet therapy works better than placebo to ease arthritis pain or other symptoms. These products could be a waste of money, but probably are low risk. Copper bracelets were also not found to have a significant effect on
Treatments

Relaxation Therapies or Meditation
Techniques to help you relax or ease stress can help you manage chronic pain or anxiety that's common with having a disease like RA. Relaxation therapies include biofeedback, self-hypnosis, deep breathing techniques, meditation, or guided imagery. There are therapists trained to help you learn to do any of these relaxation techniques properly, but you can also teach yourself to do them by using online videos or tapes. Tai chi and Yoga may also be done in combination with techniques like meditation to help you relax.

Usually, relaxation is considered safe and healthy, but if you've had anxiety or depression, check with your doctor or psychologist to make sure it's OK for you. For more information, go here:

Hydrotherapy
Water therapies use warm water in baths, showers, hot tubs, heated pools, or spas to help you relax tight, sore muscles or ease joint pain. “Hydro” means water. Hydrotherapy can also mean exercising in warm water. Studies show that warm-water exercise is a good way to build strength and fitness if you have arthritis. You can use a warm shower to loosen stiff joints in the morning, or you may find a soak in a spa tub to soothe sore, aching muscles. Some research has shown hydrotherapy helpful for pain relief. Talk to your doctor or physical therapist about the best ways for you to use hydrotherapy safely and effectively.

To learn more about CAM in general, visit the National Center for Complementary and Integrative Health's website:
https://nccih.nih.gov/health/integrative-health

II. MENTAL OUTLOOK

Being diagnosed with a chronic disease like RA can make you feel confused, distressed, or hopeless. You have to deal with physical pain that leads to emotional pain, because you're unable to go about your daily life or normal activities. While these temporary feelings of sadness are expected, if they last for more than a few weeks they may progress into depression that needs medical treatment. Some symptoms of depression are:

- Anxiety
- Feelings of sadness or irritation
- Emptiness, hopelessness, or worthlessness
- Fatigue or decreased energy
- Trouble concentrating, remembering, and making decisions
- Having irregular sleep patterns, either from not being able to sleep or sleeping too much
- Changes in your diet, such as either eating too much or not wanting to eat at all
- Thoughts of death or suicide (or suicide attempts)
- Aches, pains, cramps, headaches, or digestive problems without a clear physical cause that don’t get better with treatment

People with chronic medical conditions have higher rates of depression for many reasons: the stress of treatment, the physical pain of the disease, and the interruption of a normal life. Although depression is common, it is NOT normal. What’s important to remember is that you are not alone. Your depression can be treated. Talk to your doctor about seeing a psychiatrist, starting different types of therapy, or taking medication to help ease your depression.

You can also take steps to develop better resilience, or the ability to learn from your challenges and stressors and rebound from them. This can help you keep up your mental and physical strength in the face of pain and anger due to your disease.
RAISETHEVOICE: Care for your RA includes not just the physical symptoms of the disease, but also your emotional health and personal happiness. Seek help right away if you ever feel like you’re alone, that you’re in need of emotional support, or that RA is becoming too much to bear on a day-to-day basis. Yes, doctors and nurses can seem like they’re in a rush sometimes. Ask them to slow down and listen to your needs. Include emotional or mental struggles you have in your list of symptoms when you go for a doctor’s appointment — they’re just as important as pain or stiffness. Seek a mental-health professional for therapy or counseling if you sense that RA is making you depressed, anxious, ruining your sleep, or making it impossible to get through the day. Also, online and local support groups of fellow patients with RA and chronic illnesses can be places of comfort and companionship. You are not alone! Your emotional health and wellness are essential as you make your RA journey.
Treatments

III. DIET AND NUTRITION

Arthritis deals with your body’s inflammatory response. The joint pain, swelling, and lack of mobility all happen because of inflammation in your body.

While there is no special “diet” an arthritis patient should follow — despite what you may have heard or read online — research shows that eating certain foods, particularly those you’ll find in a Mediterranean diet, can keep inflammation in check. Other diets include going gluten free and following the Autoimmune Protocol. Diets can also be good for heart health and just feeling your best. You can seek council from dietitians, naturopaths, and nutritionists, and always make sure to consult your doctor.

☑️ Try incorporating more of these foods into your diet. Keep track of your symptoms to see if your symptoms improve:

**Fish:** Some fish are rich in omega-3 fatty acids, which reduce inflammatory proteins in your body. These are salmon, tuna, sardines, anchovies, and other cold-water fish. Get at least 3-4 ounces of fish twice a week.

**Fruits and vegetables:** Fruits and vegetables have antioxidants, which support your immune system and may fight inflammation. Eat a colorful variety of fruits and veggies like blueberries, blackberries, cherries, strawberries, spinach, kale, or broccoli. Get at least 1.5-2 cups of fruit and 2-3 cups of vegetables per meal.

**Nuts:** These tasty treats are rich in monounsaturated fat, protein, and fiber, which help make you feel full and fight inflammation. Snack on or add these nuts to your meals: walnuts, pine nuts, pistachios, and almonds. Get 1.5 ounces (about a handful) of nuts per day. More nuts could add too many calories to your diet.
Treatments

**Beans:** Rich in fiber and protein, beans are full of antioxidant and anti-inflammatory compounds.

**Olive oil:** This heart-healthy fat contains monounsaturated fat, antioxidants, and oleocanthal, an anti-inflammatory compound. Get 2-3 tablespoons per day of extra virgin olive oil in your cooking or salad dressings.

**Onions:** These simple, flavor-rich veggies contain lots of antioxidants and may help reduce inflammation, improve heart health, or help control cholesterol.

**Fiber:** In foods like beans, whole-grain breads and cereals, or fresh veggies and fruits, fiber makes you feel fuller longer and helps you stay regular. It also lowers C-reactive protein, which is found in the blood and is a strong marker of inflammation. Get plenty of fiber in your diet or try fiber supplements.

**Foods to consider avoiding or reducing:**

**Processed food:** Reduce the amount of processed food (like packaged snack chips, pastries, cookies, and other sweets). Avoid too much refined sugar, salt, and alcohol in your diet to help reduce your levels of inflammation and maintain a healthy weight.

**Gluten/wheat:** Gluten, a protein found in wheat, rye, spelt, kamut, triticale, and some other grains may irritate the digestive tract, exacerbating autoimmune conditions like RA. An elimination diet may be helpful for four to six weeks to note whether this food is a contributor to pain, digestive, and/or skin problems associated with RA. Consult your physician or nutritionist before embarking on a gluten free trial if you have issues with keeping weight on.

**Nightshades:** Some people believe that nightshade vegetables, such as eggplant, peppers, tomatoes, and potatoes, trigger arthritis flares. There is little evidence to support this, but you can still try an elimination for two weeks or more to see if you feel better. Reintroduce nightshades after the elimination period to see if your pain flares up, and if it does flare up, limit nightshades. If you feel fine after the reintroduction, then do not worry about eating nightshades.

**Fad diets:** Don’t try any diets that list lots of claims about how they’ll get rid of your arthritis symptoms, cure your arthritis, or allow you to stop using all of your arthritis drugs. Talk to your doctor before you try any diet, start eating a certain food in large quantities, or start cutting out whole groups of foods. Also be wary of any diet that requires you to buy anything up front, such as the actual diet plan, foods, supplements, or products. You can eat a healthy, natural diet made of foods that you can find at your local store.

For more information on an anti-inflammatory diet, go here:

https://creakyjoints.org/education/anti-inflammatory-diet/

**Herbs and Supplements**

Some people with RA also feel better or have symptom relief with herbal and dietary supplements. There are many to choose from, but there’s not much solid, scientific evidence to show they really work. Some herbs and supplements have been studied in smaller scale tests compared to pharmaceuticals, due to several factors. Most notably, high quality research on natural products and dietary supplements are difficult to obtain due to the high cost of doing research and the difficulty for manufacturers to patent natural products. In almost every case, herbs and supplements need to be researched more to say if they will work for RA or not.

However, it’s up to you if you want to give them a try. They may work for some people with RA, but not for others. Or they may make you feel a little bit better, but they won’t replace your arthritis drugs.
Treatments

Before you take any herbal treatments or dietary supplements, including vitamins or minerals, let your doctor know. Some herbs and supplements can interact with medicines, or even do the same thing — so they can add to the effects of your drugs. So let your doctor know everything you are taking for your arthritis.

In addition, there’s not much testing of herbs or supplements you find in health food stores, online, at alternative healing shops or fairs, or other sources. Some products may not even contain what the bottle or package says it does. Or the actual concentration of the dosage may be very different from what the label states. So use caution and good sense before you buy or try anything. Consult a physician who is knowledgeable about dietary supplements and can guide you on selecting high quality supplement brands to enhance the safety and effectiveness of your treatment regimen. Physicians trained in the specialty of integrative medicine have the highest level of training and comfort level with dietary supplements, nutrition plans, and lifestyle modification to combine with conventional medicine treatments. Collaboration between your rheumatologist and integrative physician may help ensure the safest, most effective treatment plan if you choose to use supplements with your medications to control RA and promote wellness.

Here’s an online source of information for choosing reputable, independently tested supplements:

Here’s an overview of using herbs and supplements for arthritis to let you know some of the pros and cons of dietary supplements and diets:

🔗 http://www.hopkinsarthritis.org/patient-corner/disease-management/ra-complementary-alternative-medicine/

The following is a descriptive list of some dietary supplements patients have used to support their health. Take note that research on these products and other therapies for RA occur over time to either support or discourage their use. Check with a physician who is knowledgeable about natural products to get the full assessment of risks, benefits, and potential interactions with your medications.

While research is mixed on the effectiveness of most CAM therapies for arthritis symptoms, some show promise. It’s most likely that you will find these therapies helpful as part of your overall RA treatment plan, but they won’t be a magic cure for your symptoms or allow you to stop taking your medications.

<p>| <strong>Avocado Soybean Unsaponifiables (ASU)</strong> | A natural vegetable extract made from avocado oil and soybean oil. | May improve pain or function. |
| <strong>Black Currant Oil</strong> | An natural supplement made from 15-20% gamma-linolenic acid (GLA). Rich in omega-3 and omega-6 fats. | May ease inflammation. |
| <strong>Borage Oil</strong> | Made from 20-26% GLA. Also called borage seed oil. Rich with essential fatty acids. | May ease inflammation or act to block inflammatory cells. |
| <strong>Boswellia</strong> | Also called Indian Frankincense. Made from the boswellia serrata plant. | May ease pain and improve joint function. |
| <strong>Bromelain</strong> | Supplement made from pineapple enzymes. | May reduce joint pain. |</p>

<tr>
<td>Flaxseed Oil</td>
<td>Herbal supplement taken in capsule form. It’s rich in alpha-linoleic acid (ALA), an essential omega-3 fatty acid that builds healthy cells.</td>
<td>Herbal supplement taken in capsule form. It’s rich in alpha-linoleic acid (ALA), an essential omega-3 fatty acid that builds healthy cells.</td>
</tr>
<tr>
<td>Ginger</td>
<td>Natural root ground into powder, taken in capsule or oil form, added to foods or eaten in tea, pickled, or candied form.</td>
<td>Could reduce chemicals in your body that play a role in inflammation. Could also ease pain in a similar way as aspirin. Effective at easing nausea.</td>
</tr>
<tr>
<td>GLA</td>
<td>Gamma linoleic acid, found in other herbs like borage oil or evening primrose. Rich in omega-6 fatty acids.</td>
<td>Rich in omega-6 fatty acids. Used in supplement or food form to ease joint pain, stiffness, and swelling.</td>
</tr>
<tr>
<td>Glucosamine Sulfate</td>
<td>Supplement made from the shells of fish like shrimp or crabs (avoid if with shellfish allergy).</td>
<td>Used to slow deterioration of joint cartilage, relieve joint pain related to osteoarthritis, and improve joint mobility.</td>
</tr>
<tr>
<td>Green-lipped Mussel</td>
<td>Shellfish found in the waters off New Zealand. Its hard shells are ground into powder and put in capsules. It’s rich in omega-3 fatty acids.</td>
<td>May have anti-inflammatory effects and ease joint pain.</td>
</tr>
<tr>
<td>Melatonin</td>
<td>Supplement containing a natural hormone that’s found in your brain. The hormone helps control your circadian rhythms, which tell your brain when to sleep and when to wake.</td>
<td>Melatonin capsules may help you sleep better if your RA symptoms keep you awake. Nightmares or vivid dreams may occur with this supplement.</td>
</tr>
<tr>
<td>MSM</td>
<td>Methylsulfonylmethane, an organic sulfur compound found in animals and plants. It’s often taken in capsules or in a cream that you rub into your skin.</td>

<tbody>
<tr>
<td>Rose Hips</td>
<td>Herbal supplement made from the tiny fruits of wild rose bushes. Found in capsule form as well as teas. Rich in polyphenols and anthocyaninins, natural chemicals.</td>
<td>May ease joint inflammation. Also rich in vitamin C, an antioxidant.</td>
</tr>
<tr>
<td>Sam-E</td>
<td>Short for S-adenosyl methionine. Found naturally in the body, it is a precursor to making serotonin, which helps regulate mood. Taken in capsule or pill form,</td>
<td>Used as a supplement to treat pain, stiffness, and swelling, rebuild cartilage, and improve mobility. Sam-E may also help improve depressed mood.</td>
</tr>
<tr>
<td>St. John’s Wort</td>
<td>Herbal supplement made from a flowering plant found mostly in Europe.</td>
<td>Used to ease mild to moderate depression symptoms, but some say it can reduce inflammation and pain in arthritis. <em>Do not take with birth control or HIV medications.</em></td>
</tr>
<tr>
<td>Stinging Nettle</td>
<td>Herbal supplement made from a common plant that stings your skin if you brush by it. It can be eaten or cooked into food, or taken as a supplement.</td>
<td>Used to ease inflammation and pain, and may work best for hayfever. Its use in RA has been studied primarily in vitro (test tubes) and may be helpful in reducing joint pain.</td>
</tr>
<tr>
<td>Thunder God Vine Tripterygium wilfordii</td>
<td>Herbal supplement made from a plant. One large study compared it to sulfasalazine (Azulfidine®) which is used to treat RA, and found it effective, with a list of mild to moderate side effects.</td>
<td>Used to improve pain, tender joints, and inflammation in RA.</td>
</tr>
<tr>
<td>Valerian</td>
<td>Herbal supplement made from a plant root. Can be taken in capsule form or as a tea.</td>
<td>Used mainly to treat insomnia, but may also ease pain, and have antispasmodic and sedative effects that could relax tense muscles or joints.</td>
</tr>
<tr>
<td>Vitamin D</td>
<td>A hormone used by every cell of the body, derived from the conversion of inactive vitamin D to its active form by sunlight exposure to the skin.</td>
<td>Helps improve bone density. <em>Can become toxic if taken in high amounts for a long period of time. Have your physician check your vitamin D-25 OH levels periodically.</em></td>

⚠️ The information in these guidelines should never replace the information and advice from your treating physician. It is meant to inform the discussion that you have with healthcare professionals, as well as others who play a role in your care and well being.
PART SEVEN

Remission

What it means to be in remission
If your physician tells you that your RA is in remission... first of all, congratulations! That’s the goal of your RA treatment plan.

What is remission? It means that your disease activity score is below a certain point. This score is based on several pieces of information that your doctor will collect from you:

- Answers to a questionnaire about your levels of pain, activity, and mobility
- Examining 28 of your joints to see how tender, sore, or stiff they are
- Lab tests, like blood tests, that measure levels of inflammation in your body — things like C-reactive protein (CRP)

Your doctor will look at all of your test results to come up with your disease activity level. There is no one “correct” tool to say you’re in remission or you’re not there yet. Your doctor’s or nurse’s judgment always comes first. Just because you have a certain test result doesn’t mean that your RA isn’t still active. And just because you feel great and can do tasks you couldn’t do before you started your treatments — like wash the car or weed the garden — doesn’t mean that your inflammation isn’t still a problem.

What happens when you hit that goal and reach remission?
The general recommendation for people in remission is that your doctor taper your medication dosage down to a smaller level, but not take you off RA treatment altogether. “Tapering” is carefully defined in RA: “Scaling back therapy one medication at a time (reducing dose or dosing frequency).” How soon and how quickly you begin tapering is different for each individual. It may take months or even years before tapering is right for you.

So your doctor may cut down on how much of one of the RA drugs you take, or cut back on how many times you take it per week or month. If you take more than one drug, your doctor can then taper the others one at a time.

Tapering can have a lot of benefits for you. You may not have to take as many pills or shots or infusions as you once did. You may not have to fill as many prescriptions or deal with as many drug co-pays. You may not have as many side effects from your treatments, because your dosages are lower.

But you won’t stop taking arthritis drugs altogether in most cases. Because if you do, your inflammation could come back. And as you taper your treatments, your doctor will watch your disease activity to make sure the new approach is working for you.

Any decision about your treatment plan once you’re in remission should be made with your values and preferences in mind. You and your doctor should have a conversation to go over all of your options so you can try to stay in remission and cut down on your risk of a flare.

⚠️ The information in these guidelines should never replace the information and advice from your treating physician. It is meant to inform the discussion that you have with healthcare professionals, as well as others who play a role in your care and well being.
In today’s healthcare environment, co-payments for drugs are one of the most important and hotly debated topics. Your drug co-pay is the amount you will pay out of pocket for your prescription drugs — what’s not covered by your insurance.

Because many complex RA medicines, such as biologics, can have very high retail prices, drug co-pay support programs offered by the drugs’ manufacturers or others can help many people afford their treatments. Co-pay card programs are generally not accepted for use if you have any type of government insurance covering your medication such as Medicare, Medicaid, or Tricare.

There are three main types of support: co-pay assistance programs that are like coupons for your drugs; pharmaceutical companies’ assistance programs; and patient assistance foundation programs. CreakyJoints.org has a great deal of information on these programs for arthritis patients: [https://creakyjoints.org/support/arthritis-copay-cards-assistance/](https://creakyjoints.org/support/arthritis-copay-cards-assistance/)

Or, you can email us at info@creakyjoints.org to ask any questions about assistance in obtaining your RA medication.

You can look at the websites for your drugs to find out if the manufacturer offers a co-pay assistance program, such as a coupon, rebate, drug card, or other options. Unfortunately, these programs are not available if you are on Medicare. You can find your drug’s website by entering the brand name into any internet search engine (such as Google), but usually, they’re the brand name of the drug followed by .com

You can also ask your rheumatologist, rheumatology health professionals like nurses or physician assistants, rheumatology office support staff, or your pharmacist about copay assistance programs, or how to get coupons, rebates, or other help paying for high drug costs.

**RAISE YOUR VOICE:** You always deserve access to the very best care for your arthritis. That’s one of your fundamental rights as a patient. If you worry about being able to afford any treatments, you can and should take action now. First, **talk to your doctor’s office.** They will have information about **copay assistance programs** like coupons or rebates from your treatment’s manufacturer. Also, **go online** to find your drug’s website. It will be listed under the brand name, so just do a browser search and it will come up quickly. There, you will find links to **patient assistance programs** that can help you lower your out-of-pocket costs in many cases. Also, **call your insurance company** to ask about the details of your drug coverage. **Talk to your pharmacist** or call your specialty pharmacy as well — they often have information about other treatments that may be more affordable, or know about programs that can help make your treatments more affordable. Let them know what type of drug coverage you have, so they can help you understand your options. If you’re insured at work, **talk to your benefits manager** or HR department. They should have information about your insurance policy that may help you get your drugs covered or find out more options so you can afford your treatments.

⚠️ The information in these guidelines should never replace the information and advice from your treating physician. It is meant to inform the discussion that you have with healthcare professionals, as well as others who play a role in your care and well being.
PART NINE
Ways to Make Your Voice Heard

Living with a chronic disease can impact many areas of your life. On top of communicating with your healthcare team, you will also need to be able to speak with your insurance provider, employer, support network, and elected officials.

First, we begin with the doctor's office, which usually includes multiple staff members who have multiple roles in your treatment and care.

**Who's Who in the Office**

- **Receptionist**: They will usually be the first person you interact with when you enter the office. Be nice to them, they can help ensure that others on the healthcare team are made aware of your situation. They handle the majority of the paperwork and process your insurance information.

- **Technician**: Performs your medical tests and relays the results to your physician. These tests can be X-rays, blood-tests, or CT-scans. While they certainly can offer advice, know that technicians can’t offer a definitive diagnosis.

- **Medical Assistant**: Will not provide any medical advice, but may show you to an examination room and measure your height, weight, and blood pressure. They record information relevant to your visit and relay the information to your physician.

- **Nurse (RN)**: Depending on the size or specialty of your doctor's office, your nurse will perform different actions. They are usually the ones who coordinate your care with other doctors and medical professionals. They can administer vaccinations and, in some cases, can perform biopsies and other interventions.

- **Nurse Practitioner (NP)**: Your rheumatology office may have a nurse practitioner or NP. This is a nurse with additional graduate training, such as a master's degree or doctorate, beyond their registered nurse degree. They may have specialized training or knowledge in certain types of clinical care. NPs can order and interpret your tests, diagnose conditions like high blood pressure or an infection, or prescribe your medications in certain situations.

- **Physician's Assistant (PA)**: They have a license to practice medicine, but only under a physician's guidance. They can interpret your lab results, treat injuries, and also perform exams. Some are able to prescribe medicine in certain situations.

- **Physician**: This is the one you’re probably most familiar with. With RA, you are likely going to see a rheumatologist, or a doctor who specializes in autoimmune disorders. They will perform tests and diagnoses, and prescribe you appropriate drugs. They have had the most schooling of those on this list.

It is important to disclose all information regarding medications, diet, and lifestyle choices to your physician. In order to make the best treatment recommendation, they have to consider a lot of information specific to you. Leaving out an important detail, like a medication, could lead to adverse side effects on a certain treatment.

Never hesitate to ask your physician any questions you may have about your treatment or RA in general. They are there to help!

Ways to Make Your Voice Heard

How to Talk to Your Insurance Provider

Before your talk with your provider, take a look at your plan and develop an understanding of what is covered. To do this, look at your list of benefits, or medical services that are covered. You may also find a list of closed benefits, which means your provider will not pay for the cost of any treatment not on the benefit list. On top of a benefits list you may find a “formulary,” which is a list of prescription drugs the health plan covers. It can include medications that are both brand name and generic. An “open formulary” or “preferred drug list” often has a greater choice of covered drugs. A “formulary exclusion list” is a list of prescription drugs not covered by a health plan. If you need a treatment or drug that is not on your benefits list or formulary, you and/or your doctor must ask the plan to cover it as an exception. Even if your prescribed medication is on your plan’s formulary, it will only cover that drug if it is deemed medically necessary through standards or research that states what care is most effective.

“Medically necessary” can also be referred to as “medically necessary services” or “medical necessity.” To keep track of what services your provider has covered and what money you may owe them, you can review your explanation of benefits (EOB) — a statement usually sent by mail or email from your health plan. You may find you owe money through a copay or coinsurance fee. Coinsurance is the percentage of health care expenses you pay after your deductible. Copay is the dollar amount you pay for health care expenses, most often after you meet your deductible limit.

When you speak with your insurance provider on the phone, be sure to have a good understanding of what your plan covers. If certain medications or treatments are deemed necessary by your doctor but not covered, there are appeals processes you can make to prove medical necessity.

For more information on how to talk to your insurance provider, go here:
<> http://www.ghlf.org/switching-survey-glossary/

How to Talk to Your Employer

In many cases, treatment and management of your disease mean you can experience few interruptions of your daily life. However, living with a chronic disease can sometimes impact your ability to be as productive as you’d like in your workplace. Employers may not understand the fatigue, pain, and difficulty arthritis can cause because these things are often not seen on the surface. You may wish to have a conversation with your employer explaining your diagnosis and how it might impact your performance to better their understanding. Here are some tips:

First, understand whom you should speak with. In many cases, a supervisor and your human resource department are good starting points.

Explain your diagnosis, what that means for you, and why you feel they should know.

Become familiar with your company’s disability plan and insurance policy.

Know your rights:

▸ Understand that the Family and Medical Leave Act (FMLA) allows you to take up to 12 weeks off each year for medical emergencies. This is unpaid, but will at least allow for job security.

▸ The Americans with Disabilities Act (ADA) requires employers to make reasonable adjustments for disabled workers.

If need be, it may be a good idea to request time off while you adjust to treatment.

It is also helpful to go over your benefit plan with HR if you receive health insurance from your employer.

If interviewing, it is suggested to not disclose your disease history — it could compromise your standing.

Here is a list of helpful websites you can use to research options should your condition impact your work:

State Legislature:  <> https://www.dol.gov/odep/contact/state.htm

Job Accommodation Network:  <> http://askjan.org/

How to Talk to Your Elected Officials

Your elected officials at the federal, state, and most importantly the local level are interested in helping you. After all, YOU are their constituent, and their job is to represent their constituents. Getting in contact with your elected officials' offices can help speed up the insurance claim process, help improve existing guidelines of care, and will send a message to your government that your issue is real, and needs to be taken seriously.

There are a number of reasons to contact your elected officials, and it’s important to understand that many will work to help you, but mostly on an individual level as a “constituent service.” As much as you and they may want sweeping change to the laws, change takes time and sustained interest from constituents.

So now that we’ve tempered your expectations about government, how should you go about contacting your local officials, and what can they help you with?

First you need to find them. To do so, follow this link: [http://openstates.org/](http://openstates.org/)

Your state senator, house representative, or assembly person can work to be a powerful advocate in clearing up insurance coverage issues. Furthermore, sharing your story will provide your representatives a picture of their constituents that will help inform their decisions on future legislation.

How should you share your story? While a personal hand-written letter is the most impactful way of sharing your story, a phone call or personal email is a more practical way of contacting your elected official.

You can also get involved with the 50-State Network, a national organization of patients just like you who want to make their voices heard by their elected officials. Learn more and sign up at [https://www.50statenetwork.org/](https://www.50statenetwork.org/) — this is a program developed and run by GHLF, the parent non-profit of CreakyJoints.

The ACR also brings together patients like you, rheumatologists and health professionals, and families of kids with rheumatic diseases to Washington each fall to lobby members of Congress about important legislative issues. You can find out more about joining this trip at [http://www.rheumatology.org/Advocacy/Advocates-for-Arthritis](http://www.rheumatology.org/Advocacy/Advocates-for-Arthritis).

RAISE YOUR VOICE: Everyone involved in healthcare — including elected officials, insurance providers, drug manufacturers, hospitals, pharmacies, and physician groups — should focus on you, the patient, when setting any policies or making any decisions. Healthcare is about you — your health, your treatment options, your quality of care, and your needs. Speak up if you feel that a new law, regulation, or policy will make it harder for you to access the best care. Or speak up on behalf of legislation that you believe will make getting the best care easier! Use social media, email, phone, letters, or postcards to let your voice be heard at all times.
Ways to Make Your Voice Heard

How to Talk to Your Family and Friends

When you have RA, you may not always look like you’re sick or in pain on the outside. People around you may not realize you hurt, or that your joints are stiff or hard to move. They may not realize you struggle to get out of bed in the mornings, that you have to take shots or pills, or that some activities are harder for you to do. They may not know that you sometimes feel blue because you have a chronic disease.

Talk to your friends and family about your RA so they understand what’s going on with you. Let them know some ways that they can help you cope better with the challenges of your disease, particularly if they want to be there for you. Find out which people in your life will be good sources of support when your RA flares or when you feel like it’s a lot to handle. Some family members or friends could be great exercise buddies too.

Here are a few tips for talking with your family and friends about your arthritis, and getting help when you need it:

▷ Explain a little bit about your disease, like how RA affects your body, what inflammation is, and how your joints or organs could be at risk for serious damage. Don’t try to unload an encyclopedia of information on others — just give them a few ways that RA affects you.

▷ Don’t hide your pain or other symptoms from those you love. It’s OK to admit that you are having a flare or struggling to get tasks done. Ask for help if and when you need it. Let people know ahead of time if you need help with regular tasks like getting dressed or lifting a cooking pot.

▷ Keep your friends and family up to date about your RA treatments. Make a list of the drugs and dosages you take, and give it to a couple of people in your inner circle that you trust. They may need to have this information handy in a medical emergency. Also, people that care about you want to know what you are doing to treat your disease, and how you’re doing. They can be the best cheerleaders for your treatment success!

You may want to talk to coworkers or other people you deal with from time to time about your arthritis. They may wonder about your condition when you’re not feeling well or if you need help with certain tasks.

⚠️ The information in these guidelines should never replace the information and advice from your treating physician. It is meant to inform the discussion that you have with healthcare professionals, as well as others who play a role in your care and well being.
PART TEN

About the Editors

Madelaine Hedgpeth Feldman, M.D. FACR
Dr. Feldman is the founding member and past president of the Rheumatology Alliance of Louisiana, vice-president of the Coalition of State Rheumatology Organizations (CSRO), board liaison to the Association of Women in Rheumatology, and presently serves on the insurance subcommittee for the ACR. She is also a member of the working group for the Alliance for Patient Access. A Clinical Associate Professor of Medicine at Tulane University School of Medicine, she has been named one of the Top Doctors in New Orleans for over 10 years.

Sarah Doaty, M.D.
Dr. Doaty is a rheumatologist at the Alaska Native Medical Center in Anchorage. She recently completed a rheumatology fellowship at UCLA, during which time she served on the ACR’s Fellows-in-Training Subcommittee and Government Affairs Committee. She is the co-director of the ACR’s Advocacy 101 program, a health policy training session in Washington, D.C., for rheumatology fellows and program directors. Dr. Doaty also serves on the Coalition of State Rheumatology Organizations’ Board of Directors.

Vinicius Domingues, M.D.
Dr. Domingues is currently finishing his fellowship at New York University School of Medicine and serves on ACR’s Fellows in training committee as well as the Committee on Rheumatologic care (CORC). His main research interests are in lupus, inflammatory arthritis, and antiphospholipid syndrome.

Leslie Mendoza Temple, M.D., ABOIM
Dr. Mendoza Temple serves as Medical Director of the Integrative Medicine Program at NorthShore University HealthSystem. She is a board-certified Family Practitioner who cares for adults, children, pregnant mothers, and infants with a wide variety of conditions and preventive health needs. Dr. Mendoza Temple combines conventional Western medicine with safe, evidence-based complementary medicine therapies to improve the health of her patients. She leads a large team of talented, dedicated practitioners who work together to integrate some of the best of the world's medicine.

THESE PATIENT GUIDELINES FOR RHEUMATOID ARTHRITIS WERE MADE POSSIBLE BY THE GENEROUS SUPPORT OF Eli Lilly and Company, a global pharmaceutical company headquartered in Indianapolis, Indiana.

⚠️ The information in these guidelines should never replace the information and advice from your treating physician. It is meant to inform the discussion that you have with healthcare professionals, as well as others who play a role in your care and well being.
GLOSSARY

A

Anti-cyclic citrullinated peptide proteins
An antibody present in 60 to 70% of patients with rheumatoid arthritis. About 90% of people with this antibody have or will develop rheumatoid arthritis over time. It is usually checked in the blood and can also be referred as anti-CCP.

Anxiety
A general uncomfortable feeling of nervousness and apprehension about something that is happening or about to happen.

Approved
The Food Drug Administration (FDA) has issued permission for a given medication to be commercialized for a specific disease entity.

Autoimmunity
State in which our own immune system becomes dysfunctional and starts attacking ourselves. Examples of autoimmune diseases include rheumatoid arthritis, lupus, scleroderma, and Hashimoto's thyroiditis.

B

Biologic
Highly sophisticated and genetically engineered medications that target specific components that cause inflammation. These medications have been widely used in rheumatology and oncology.

Biosimilar
Genetically engineered medication designed to have structure and activity highly similar to the original biologic licensed.

Bone density
Measurement used to assess the strength of the bones. It is widely available and is the way the diagnosis of osteoporosis is made.

BUN
Stands for blood urea nitrogen. It is a marker of kidney function and can fluctuate a little depending on dehydration status.

C

C-reactive protein
Protein released by the liver; high values correlate with the inflammation status of the body. It is widely used in blood tests to assess overall inflammation. Although sensitive, it is not specific for rheumatoid arthritis and many conditions can cause elevation.

Clinical trial
Lengthy and costly process that new medications have to go through in order to be approved by the FDA. Usually the new medication is compared to the current standard of care (best treatment available) or to placebo (no treatment).

Combination therapy
Treatment that involves being on more than one medication in order to control the disease. Some medications work better when used concomitantly (i.e. methotrexate + biologic).
**Comorbidity**
Refers to another concomitant disease one might have aside from the primary condition. For rheumatoid arthritis, many patients have as comorbidity obesity, diabetes, high blood pressure, depression, and heart disease.

**Complete blood count**
This is a blood test that reflects our white cells (army against infection), red cells (cells that carry oxygen to tissues), and platelets (fragments of cells that prevent us from bleeding).

**Contraindications**
Statement used often to reflect that one should avoid a certain type of treatment or procedure because of possible harm (i.e. a pregnant patient should never take methotrexate because it would harm the baby).

**Copayments**
Portion of the cost of medication, procedure, or hospital stay that the patient is responsible for. Generally, insurance companies cover most of the cost but the patient may be responsible for some copayment.

**Corticosteroid**
Highly effective medication to treat inflammatory disorders and widely used. Given its multiple side effects, patients should not be on it for a long period of time.

**Creatinine**
A blood test that reflects the kidney function. Since many medications are cleared and can affect kidney function, it is a very commonly checked laboratory value.

**D**

**Depression**
A state in which patients have a persistent feeling of sadness, hopelessness, and difficulty finding pleasure in things that otherwise provided them pleasure. Depression is very common in chronic disease patients.

**Disease activity**
Objective measurement of inflammation attributable to the disease. Doctors have developed tools and scoring systems to assess how mild, moderate, or severe the disease state is at a given point.

**Disease-specific markers**
Blood tests that are associated with a given disease. In rheumatoid arthritis the most specific marker is the anti-CCP.

**DMARD**
Stands for disease modifying anti-rheumatic drug. These are medications that not only alleviate symptoms but slow or stop the progression of the disease (i.e. preventing erosions, nodules, lung problems).

**Dosage**
Expression used to quantify the amount of a given medication a patient is taking. That can be expressed in many units (i.e. methotrexate 2.5mg; prednisone 30mg).

**Double therapy**
Treatment in which a patient takes two medications for the same disease. It is very similar to combination therapy but limited to two medications.
**Glossary**

**E**

**Early RA**
A term widely used to classify patients who have had symptoms of rheumatoid arthritis for less than six months. The definition, however, is controversial.

**Erythrocyte sedimentation rate**
Blood test used to assess inflammation. Very commonly used but it is not specific to rheumatoid arthritis and it can be elevated in a myriad of conditions including cancer and infections.

**Established RA**
Term used characterize patients with rheumatoid arthritis who have experienced symptoms of or have been diagnosed with rheumatoid arthritis for greater than six months.

**Evidence**
Evidence is the presence of information through research studies regarding a given intervention. The evidence can be positive or negative and many clinicians use the scientific evidence to base their treatment choices.

**F**

**Fail First**
Terminology used by providers to describe Step Therapy, as patients must first fail on less expensive medications before an insurance company will cover the cost of potentially more effective but costly options.

**G**

**Generic drug**
Medication that is equivalent to the branded (original) drug in dosage, quality, and route of administration. Usually generic drugs are less expensive.

**Glucocorticoid**
Highly effective medication to treat inflammatory disorders and widely used. Given its multiple side effects, patients should not be on it for a long period of time.

**I**

**Inflammation**
Process where our white cells (army against infections) and their products become hyperactive. Physically shown as redness, warmth, swelling, and pain.

**Inflammatory markers**
Blood tests that are surrogate markers of how inflamed the body is at a given point. These markers are routinely used in rheumatology.

**Interchangeable**
Designation given to a biosimilar beyond its structural similarity to the original drug after it has proven clinical efficacy in a patient. The practical implication is that interchangeable biosimilar may be substituted for the reference product without intervention of a physician.
GLOSSARY

J

Janus kinase inhibitor
Medication that works by inhibiting a specific pathway of the immune system called janus kinase. Medications approved include tofacitinib.

M

Monitoring
Monitoring relates to the need of frequent objective assessments (blood tests or X-rays) to measure progression of disease and side effects from the medications.

Monotherapy
Term used when only one medication is being used to treat a given disease.

N

Non-disease-specific markers
Tests that can be present in rheumatoid arthritis but are also found in a variety of diseases. Examples include elevated C-reactive protein and sedimentation rate.

Non-TNF biologic
Class of medications that are genetically engineered but the mechanism of action is not inhibition of tumor necrosis factor (TNF). Examples include abatacept, tocilizumab, and rituximab.

O

On the market
Relates to medications that are currently commercialized and available for patients.

P

Prior Authorization
A process through which a provider must request authorization from the patient’s insurance company to prescribe a particular treatment. The process is often lengthy and complicated, and can delay important patient care.

R

Radiological progression
Objective rating used by doctors to assess changes in the joint structure using X-ray exams. Usually it reflects new erosions (tiny holes) in the bone and it is a sign that the medication is not fully working.

Recommendations
Statements made by a committee comprised by very knowledgeable experts in the field of rheumatoid arthritis. They help clinicians follow a basic algorithm but in the end, treatment should be individualized.

Reference drug
Relates to the original pioneer drug. For the biosimilar example, the reference drug is the original biologic (i.e. infliximab for inflectra).

Remission
State in which signs and symptoms are controlled, and based on objective examination by the doctor, the disease activity is low. This is the ultimate goal in treating rheumatoid arthritis.
**Rheumatoid arthritis**
Autoimmune disorder characterized by progressive joint inflammation that can lead to joint damage and destruction.

**Rheumatoid factor**
Antibody present in patients with rheumatoid arthritis but also seen in a variety of other conditions. It is tested through a blood sample.

**Rheumatoid nodules**
Small firm lumps that develop under the skin in patients with rheumatoid arthritis. They are generally near the inflamed joint.

**Rheumatologist**
Physician who specializes in systemic autoimmune illnesses and arthritis. Training comprises three years of internal medicine and later a two- to three-year fellowship in rheumatology.

**Self-administration**
Term used to characterize a medication that, although not necessarily as simple as a pill, can be administered by the patient without a healthcare provider being involved. Example is the subcutaneous injections for TNF inhibitors.

**Side effects**
Unwanted or undesirable effects of certain medications or procedures. All medications have side effects and that should be monitored carefully.

**Specialty pharmacy**
Specific segment of a pharmacy chain that deals with high-cost and complex medications.

**Step Therapy**
The process in which an insurer requires providers to follow “tiers” based on cost when prescribing medications. In most cases, the least expensive medication must be prescribed first, and progression to other options is only allowed after a patient has been shown to “fail” on the initial medication.

**Substitution**
Ability of the pharmacist to change from an interchangeable biosimilar to its reference drug. There is currently no available interchangeable biologic but this is expected in the near future.

**Synovium**
Membrane that surrounds the joint and produces synovial fluid, which “lubricates the joint” for smoother movement.

**TNFi biologic**
Genetically engineered medication designed to inhibit tumor necrosis factor, which plays a major role in the inflammation seen in rheumatoid arthritis. These medications are approved for rheumatoid arthritis and have revolutionized the field of rheumatology.

**Transaminase**
Liver enzymes that are measurable through a blood test. The liver metabolizes most medications; therefore, it is important to monitor such enzymes to assess if the drugs are causing any damage to the liver.
**Treatment Guidelines**
Published periodically, treatment guidelines are designed to help standardize care for a given disease. It is normally a consensus of multiple experts in the field who thoroughly evaluate the scientific evidence and develop clinical guidelines.

**Treatment plan**
The result of a conversation between the patient and doctor. It outlines a strategy on how to cope with the disease. That includes medications, physical therapy, and alternative therapies.

**Triple therapy**
Term used describe treatment of rheumatoid arthritis with three specific medications. Generally medications are methotrexate, hydroxychloroquine, and sulfasalazine.

**Tumor necrosis factor**
Major molecule that drives the inflammation in rheumatoid arthritis. Given the advances in pharmacology, there are now many drugs that inhibit its action, providing relief to patients.
WORKS CITED
